This text covers the basic facts and interpretation of microscopic anatomy. It emphasizes the relationship and concepts by which cell and tissue structure are inextricably linked with their function. Numerous photomicrographs and electron micrographs should amplify the text and remind the user of the laboratory basis of the study of histology. An atlas section containing 105 color plates is also included. Emphasis on diagrams, illustrations, and charts that summarize morphologic and functional features of cells, tissues, and organs, and inclusion of clinical correlations in each chapter to further illustrate the direct application of basic histological information to diagnosis, prognosis, pathobiology, and clinical aspects of disease, should appeal to students, who are anxious to see how the basic sciences taught in the first two years of medical school relate to the clinical aspects thereafter.

Catalyst Deactivation 1994 was an expansion of earlier, highly successful symposia. The objective of the symposium was to promote a scientific approach of the phenomenon of catalyst deactivation which will contribute to the development of catalysts which are less subject to structural transformations and more resistant to poisons and coke formation. These aspects are dealt with in 12 plenary lectures, 48 oral presentations and 35 poster papers, which were critically selected from an impressive response from some 30 countries. Both fundamental and applied aspects were covered. The deactivation of catalysts in important industrial processes like fluid bed catalytic cracking hydrotreatment, hydrodesulfurization, catalytic reforming, hydrodenitrogenation, steam reforming, hydrodemetallization, hydrocracking, Fischer-Tropsch synthesis, propane dehydrogenation, phthalic anhydride synthesis received considerable attention. Mechanisms of poisoning, sintering and coking were further investigated and modelled and new experimental techniques for the characterization and the quantification of deactivation were also introduced.
