Each year, ninth-grade students across the United States of America fail to meet the national standards in mathematics. Students struggle to grasp the concepts needed to produce correct answers to math problems. Ninth grade students with disabilities, especially in the southeastern region of the United States, consistently fail the math portion of the Georgia Milestones Test. As a response to this problem in Georgia, Hands-On Equations by Henry Borenson represents a possible solution for many students failing to meet the standard in ninth grade mathematics. The purpose of this quantitative causal-comparative study was to examine the difference between the mathematics achievement of ninth-grade students with and without disabilities in a high school in Southeastern Georgia who received instruction with Hands-On Equations versus those who received instruction without the use of Hands-On Equations. The data used were historical data from the 2016 school year. One group of students participated in instruction using Hands-On Equations while another group received traditional teaching methods without the use of the Hands-On Equations. The participating schools were urban schools located in the Southeastern part of Georgia. Most of the students were African American, and the schools were 100% free lunch. An analysis of covariance (ANCOVA) generated comparative data. The results related to Hypothesis H01 and H03 indicated that there was a significant difference in the mathematics achievement scores for ninth-grade students with or without disabilities who received instruction with Hands-on Equations. However, results related to hypothesis H02 indicated that there was no statistically significant difference in mathematics achievement scores for ninth-grade students who did or did not receive instruction using Hands-on Equations.

A bestselling modern classic—both poignant and funny—narrated by a fifteen year old autistic savant obsessed with Sherlock Holmes, this dazzling novel weaves together an old-fashioned mystery, a contemporary coming-of-age story, and a fascinating excursion into a mind incapable of processing emotions. Christopher John Francis Boone knows all the countries of the world and their capitals and every prime number up to 7,057. Although gifted with a superbly logical brain, Christopher is autistic. Everyday interactions and admonishments have little meaning for him. At fifteen, Christopher's carefully constructed world falls apart when he finds his neighbour's dog Wellington impaled on a garden fork, and he is initially blamed for the killing. Christopher decides that he will track down the real killer, and turns to his favourite fictional character, the impeccably logical Sherlock Holmes, for inspiration. But the investigation leads him down some unexpected paths and ultimately brings him face to face with the dissolution of his parents' marriage. As Christopher tries to deal with the crisis within his own family, the narrative draws readers into the workings of Christopher's mind. And herein lies the key to the brilliance of Mark Haddon's choice of narrator: The most wrenching of emotional moments are chronicled by a boy who cannot fathom emotions. The effect is dazzling, making for one of the freshest debut in years: a comedy, a tearjerker, a mystery story, a novel of exceptional literary merit that is great fun to read.

For the fi rst time in human history, we are living in an age where the youth of our nation know more about societys cutting-edge tools than the adults charged with passing societys technical and cultural knowledge on to them. Most of our young people have far more facility with computer and telecommunications technology than our teaching corps and, generally, that gap only widens as students travel from elementary school all the way to university and beyond. Its a brave new and, often, dangerous world that todays youth must learn to navigate. Now, more than ever, they need educators to step up and teach them how to be critical thinkers able to discriminate between the true and the merely seductive, to see beyond the glossy veneer on harmful websites harmful ideas and, sadly, harmful people in both the real and cyber worlds. We need to spend a little less time teaching students how to take standardized tests and a lot more time developing their critical faculties, so they will be able to solve lifes problems, profi t from challenging situations, and understand the increasingly complex world they must ken at an earlier and earlier age.

The main reason I write this book was just to fullfil my long time dream to be able to tutor students. Most students do not bring their text books at home from school. This makes it difficult to help them. This book may help such students as this can be used as a reference in understanding Algebra and Geometry.

The Big Fat Notebooks go to high school! A lively, fully illustrated guide to acing high school geometry, with clear notes on the big ideas, helpful tips for memorizing processes and remembering definitions, and lively doodles that make math easier to understand (and fun to study).
