Don't bother looking in the history books for what has killed the most Americans. Look instead at your dinner table. We eat too much of the wrong foods and not enough of the right foods. Scientific research continually indicates nationwide vitamin and mineral deficiencies in our country, and we spend over a trillion dollars each year on disease care. Is it any surprise that doctors consistently place among the very highest incomes? Andrew Saul has seen enough of this situation, and in Doctor Yourself, he gives you the power you need to change it. Citing numerous scientific evidence, as well as case studies from his decades of practice, Dr. Saul explodes the myth that an army of medical specialists and pharmaceutical drugs are necessary to maintain our health. The human body evolved to live well and fight off disease on a supply of only a dozen or so essential nutrients. Unfortunately, modern meat-laden, high-sugar diets provide catastrophically inadequate levels of those nutrients. Using the guidelines and protocols for diet and vitamin megadosing laid out in Doctor Yourself, you can not only prevent disease from getting a foothold in the first place, but also literally cure yourself of illnesses already in progress without resorting to drugs or surgery. One of the most comprehensive guides to nutritional therapy ever published, Doctor Yourself provides proven methods for combating almost every possible health condition-from asthma and Alzheimer's disease to cancer, depression, heart disease, and more-all presented in Dr. Saul's unforgettable style. Whether he's delivering commonsense tips on subjects such as weight loss and longevity or praising the healthy glow of a carotene tan, Dr. Saul takes the starch out of healthcare and makes taking charge of your family's health an experience both valuable and fun.

This volume is the newest release in the authoritative series of quantitative estimates of nutrient intakes to be used for planning and assessing diets for healthy people. Dietary Reference Intakes (DRIs) is the newest framework for an expanded approach developed by U.S. and Canadian scientists. This book discusses in detail the role of vitamin C, vitamin E, selenium, and the carotenoids in human physiology and health. For each nutrient the committee presents what is known about how it functions in the human body, which factors may affect how it works, and how the nutrient may be related to chronic disease. Dietary Reference Intakes provides reference intakes, such as Recommended Dietary Allowances (RDAs), for use in planning nutritionally adequate diets for different groups based on age and gender, along with a new reference intake, the Tolerable Upper Intake Level (UL), designed to assist an individual in knowing how much is "too much" of a nutrient.

**This book explores in depth the relation between physical activity and cancer control, including primary prevention, coping with treatments, recovery after treatments, long-term survivorship, secondary prevention, and survival. The first part of the book presents the most recent research on the impact of physical activity in preventing a range of cancers. In the second part, the association between physical activity and cancer survivorship is addressed. The effects of physical activity on supportive care endpoints (e.g., quality of life, fatigue, physical functioning) and disease endpoints (e.g., biomarkers, recurrence, survival) are carefully analyzed. In addition, the determinants of physical activity in cancer survivors are discussed, and behavior change strategies for increasing physical activity in cancer survivors are appraised. The final part of the book is devoted to special topics, including the relation of physical activity to pediatric cancer survivorship and to palliative cancer care.**

The brain is the most complex organ in our body. Indeed, it is perhaps the most complex structure we have ever encountered in nature. Both structurally and functionally, there are many peculiarities that differentiate the brain from all other organs. The brain is our connection to the world around us and by governing nervous system and higher function, any disturbance induces severe neurological and psychiatric disorders that can have a devastating effect on quality of life. Our understanding of the physiology and biochemistry of the brain has improved dramatically in the last two decades. In particular, the critical role of cations, including magnesium, has become evident, even if incompletely understood at a mechanistic level. The exact role and regulation of magnesium, in particular, remains elusive, largely because intracellular levels are so difficult to routinely quantify.

Nonetheless, the importance of magnesium to normal central nervous system activity is self-evident given the complicated homeostatic mechanisms that maintain the concentration of this cation within strict limits essential for normal physiology and metabolism. There is also considerable accumulating evidence to suggest alterations to some brain functions in both normal and pathological conditions may be linked to alterations in local magnesium concentration. This book, containing chapters written by some of the foremost experts in the field of magnesium research, brings together the latest in experimental and clinical magnesium research as it relates to the central nervous system. It offers a complete and updated view of magnesium's involvement in central nervous system function and in so doing, brings together two main pillars of contemporary neuroscience research, namely providing an explanation for the molecular mechanisms involved in brain function, and emphasizing the connections between the molecular changes and behavior. It is the untiring efforts of those magnesium researchers who have dedicated their lives to unraveling the mysteries of magnesium's role in biological systems that has inspired the collation of this volume of work.

From the authors of the acclaimed cookbooks *Eleven Madison Park* and *I Love New York* comes this uniquely packaged cookbook, featuring recipes from the wildly popular restaurant and, as an added surprise, a hidden back panel that opens to reveal a separate cocktail book. Chef Daniel Humm and his business partner Will Guidara are the proprietors of two of New York's most

beloved and pioneering restaurants: Eleven Madison Park and The NoMad. Their team is known not only for its perfectly executed, innovative cooking, but also for creating extraordinary, genre-defying dining experiences. The NoMad Cookbook translates the unparalleled and often surprising food and drink of the restaurant into book form. What appears to be a traditional cookbook is in fact two books in one: upon opening, readers discover that the back half contains false pages in which a smaller cocktail recipe book is hidden. The result is a wonderfully unexpected collection of both sweet and savory food recipes and cocktail recipes, with the lush photography by Francesco Tonelli and impeccable style for which the authors are known. The NoMad Cookbook promises to be a reading experience like no other, and will be the holiday gift of the year for the foodie who has everything.

This book by the National Institutes of Health (Publication O6-4082) and the National Heart, Lung, and Blood Institute provides information and effective ways to work with your diet because what you choose to eat affects your chances of developing high blood pressure, or hypertension (the medical term). Recent studies show that blood pressure can be lowered by following the Dietary Approaches to Stop Hypertension (DASH) eating plan-and by eating less salt, also called sodium. While each step alone lowers blood pressure, the combination of the eating plan and a reduced sodium intake gives the biggest benefit and may help prevent the development of high blood pressure. This book, based on the DASH research findings, tells how to follow the DASH eating plan and reduce the amount of sodium you consume. It offers tips on how to start and stay on the eating plan, as well as a week of menus and some recipes. The menus and recipes are given for two levels of daily sodium consumption-2,300 and 1,500 milligrams per day. Twenty-three hundred milligrams is the highest level considered acceptable by the National High Blood Pressure Education Program. It is also the highest amount recommended for healthy Americans by the 2005 "U.S. Dietary Guidelines for Americans." The 1,500 milligram level can lower blood pressure further and more recently is the amount recommended by the Institute of Medicine as an adequate intake level and one that most people should try to achieve. The lower your salt intake is, the lower your blood pressure. Studies have found that the DASH menus containing 2,300 milligrams of sodium can lower blood pressure and that an even lower level of sodium, 1,500 milligrams, can further reduce blood pressure. All the menus are lower in sodium than what adults in the United States currently eat-about 4,200 milligrams per day in men and 3,300 milligrams per day in women. Those with high blood pressure and prehypertension may benefit especially from following the DASH eating plan and reducing their sodium intake.

*With over 50,000 distinct species in sub-Saharan Africa alone, the African continent is endowed with an enormous wealth of plant resources. While more than 25 percent of known species have been used for several centuries in traditional African medicine for the prevention and treatment of diseases, Africa remains a minor player in the global natural products market largely due to lack of practical information. This updated and expanded second edition of the Handbook of African Medicinal Plants provides a comprehensive review of more than 2,000 species of plants employed in indigenous African medicine, with full-color photographs and references from over 1,100 publications. The first part of the book contains a catalog of the plants used as ingredients for the preparation of traditional remedies, including their medicinal uses and the parts of the plant used. This is followed by a pharmacognostical profile of 170 of the major herbs, with a brief description of the diagnostic features of the leaves, flowers, and fruits and monographs with botanical names, common names, synonyms, African names, habitat and distribution, ethnomedicinal uses, chemical constituents, and reported pharmacological activity. The second part of the book provides an introduction to African traditional medicine, outlining African cosmology and beliefs as they relate to healing and the use of herbs, health foods, and medicinal plants. This book presents scientific documentation of the correlation between the observed folk use and demonstrable biological activity, as well as the characterized constituents of the plants.*

*The instant New York Times bestseller The New York Times Best Selling author of The End of Alzheimer's lays out a specific plan to help everyone prevent and reverse cognitive decline or simply maximize brainpower. In The End of Alzheimer's Dale Bredesen laid out the science behind his revolutionary new program that is the first to both prevent and reverse symptoms of Alzheimer's disease. Now he lays out the detailed program he uses with his own patients. Accessible and detailed, it can be tailored to anyone's needs and will enhance cognitive ability at any age. What we call Alzheimer's disease is actually a protective response to a wide variety of insults to the brain: inflammation, insulin resistance, toxins, infections, and inadequate levels of nutrients, hormones, and growth factors. Bredesen starts by having us figure out which of these insults we need to address and continues by laying out a personalized lifestyle plan. Focusing on the Ketoflex 12/3 Diet, which triggers ketosis and lets the brain restore itself with a minimum 12-hour fast, Dr. Bredesen drills down on restorative sleep, targeted supplementation, exercise, and brain training. He also examines the tricky question of toxic exposure and provides workarounds for many difficult problems. The takeaway is that we do not need to do the program perfectly but will see tremendous results if we can do it well enough. With inspiring stories from patients who have reversed cognitive decline and are now thriving, this book shifts the treatment paradigm and offers a new and effective way to enhance cognition as well as unprecedented hope to sufferers of this now no longer deadly disease.*

"Caffeine in Food and Dietary Supplements" is the summary of a workshop convened by the Institute of Medicine in August 2013 to review the available science on safe levels of caffeine consumption in foods, beverages, and dietary supplements and to identify data gaps. Scientists with expertise in food safety, nutrition, pharmacology, psychology, toxicology, and related disciplines; medical professionals with pediatric and adult patient experience in cardiology, neurology, and psychiatry; public health professionals; food industry representatives; regulatory experts; and consumer advocates discussed the safety of caffeine in food and dietary supplements, including, but not limited to, caffeinated beverage products, and identified data gaps. Caffeine, a central nervous stimulant, is arguably the most frequently ingested pharmacologically active substance in the world. Occurring naturally in more than 60 plants, including coffee beans, tea leaves, cola nuts and cocoa pods, caffeine has been part of innumerable cultures for centuries. But the caffeine-in-food landscape is changing. There are an array of new caffeine-containing energy products, from waffles to sunflower seeds, jelly beans to syrup, even bottled water, entering the marketplace. Years of scientific research have shown that moderate consumption by healthy adults of products containing naturally-occurring caffeine is not associated with adverse health effects. The changing caffeine landscape raises concerns about safety and whether any of these new products might be targeting populations not normally associated with caffeine consumption, namely children and adolescents, and whether caffeine poses a greater health risk to those populations than it does for healthy adults. This report delineates vulnerable populations who may be at risk from caffeine exposure; describes caffeine exposure and risk of cardiovascular and other health effects on vulnerable populations, including additive effects with other ingredients and effects related to pre-existing conditions; explores safe caffeine exposure levels for general and vulnerable populations; and identifies data gaps on caffeine stimulant effects.

The instant New York Times and Wall Street Journal bestseller A groundbreaking plan to prevent and reverse Alzheimer's Disease that fundamentally changes how we understand cognitive decline. Everyone knows someone who has survived cancer, but until now no one knows anyone who has survived Alzheimer's Disease. In this paradigm shifting book, Dale Bredesen, MD, offers real hope to anyone looking to prevent and even reverse Alzheimer's Disease and cognitive decline. Revealing that AD is not one condition, as it is currently treated, but three, The End of Alzheimer's outlines 36 metabolic factors (micronutrients, hormone levels, sleep) that can trigger "downsizing" in the brain. The protocol shows us how to rebalance these factors using lifestyle modifications like taking B12, eliminating gluten, or improving oral hygiene. The results are impressive. Of the first ten patients on the protocol, nine displayed significant improvement with 3-6 months; since then the protocol has yielded similar results with hundreds more. Now, The End of Alzheimer's brings new hope to a broad audience of patients, caregivers, physicians, and treatment centers with a fascinating look inside the science and a complete step-by-step plan that fundamentally changes how we treat and even think about AD.
