Discusses the basics of DOS, Lotus 1-2-3, WordPerferct, and dBASE, with an overview of each and instructions for the uses and functions of each Advanced Turbo C Programming provides the necessary programming tools for programmers who are interested in learning new skills in developing some useful tools and PC applications using the Turbo C Version 1.5 programming language and environment. This book covers both the advanced programming features of the IBM PC and Turbo C. It is organized into five sections. In Section 1 the proposed ANSI standard features, tips and techniques about C programming style, working with the C preprocessor, and tips for using pointers and managing memory allocation tasks are introduced. Section 2 discusses techniques for constructing useful and reliable data structures from linked lists to binary trees. The third section provides the complete Turbo C I/O system and takes an in-depth look at the many tools that Turbo C provides for accessing files and other I/O devices. Section 4 explains the techniques for interacting with DOS and the special features of Turbo C such as the Borland Graphic Interface (BGI). The final section, Section 5 presents the tools and techniques for developing Turbo C-like user interfaces, such as pop-up windows, pop-up menus, and pulldown menus. Computer programmers will find the text invaluable. Power tools. Programming pointers. Useful units. Designing the user interface. Expanding the possibilities. Using expanded memory. BIOS and DOS services. Memory-resident programming. Using the mouse. The program segment prefix. Using assembler with Turbo Pascal. Data-entry screens. Using the Borland toolboxes. With the strong competition that is arising for water resources the modernisation of irrigation systems is becoming a critical issue. One of the alternatives to modernisation is the use of pressurised systems to replace part of the existing networks. This publication analyses the performance of pressurised irrigation systems operating on demand, and provides revised criteria for the design of such irrigation networks. For this purpose, new approaches and a computer program have been developed. The program has been tested in several field situations in the Mediterranean Basin and has demonstrated its usefulness not only by quickly identifying weak points in irrigation networks but also by

identifying the power requirements of pumping stations needed to satisfy varying demand situations.

Featuring over 130 concise and easy-to-enter program examples, users will learn to write simple and complex programs; create data types and files; simplify complex programs; use pointers, memory management techniques, single and muliti-way lists and trees; employ advanced pascal programming techniques; and create string operations.

This high-powered book reveals the inside tips and techniques used by successful Turbo Pascal programmers. Helps users push the language to the limits. The most informative text for Turbo Pascal 5.0.
