Gilbert Strang's clear, direct style and detailed, intensive explanations make this textbook ideal as both a course companion and for self-study. Single variable and multivariable calculus are covered in depth. Key examples of the application of calculus to areas such as physics, engineering and economics are included in order to enhance students' understanding. New to the third edition is a chapter on the 'Highlights of calculus', which accompanies the popular video lectures by the author on MIT's OpenCourseWare. These can be accessed from math.mit.edu/~gs.

College Algebra provides a comprehensive exploration of algebraic principles and meets scope and sequence requirements for a typical introductory algebra course. The modular approach and richness of content ensure that the book meets the needs of a variety of courses. College Algebra offers a wealth of examples with detailed, conceptual explanations, building a strong foundation in the material before asking students to apply what they've learned. Coverage and Scope In determining the concepts, skills, and topics to cover, we engaged dozens of highly experienced instructors with a range of student audiences. The resulting scope and sequence proceeds logically while allowing for a significant amount of flexibility in instruction. Chapters

1 and 2 provide both a review and foundation for study of Functions that begins in Chapter 3. The authors recognize that while some institutions may find this material a prerequisite, other institutions have told us that they have a cohort that need the prerequisite skills built into the course. Algebra 1 covers all the topics in a first-year algebra course and builds the algebraic foundation essential for all students to solve increasingly complex problems. Higher order thinking skills use real-world applications, reasoning and justification to make connections to math strands. Algebra 1 focuses on algebraic thinking and multiple representations -- verbal, numeric, symbolic, and graphical. Graphing calculator labs model mathematical situations. - Publisher.

Biography of George Eliot (1819-1880, born as Mary Anne Evans), British writer and poet. It gives an account of what it means to become a novelist, and to think like a novelist: in particular a realist novelist for whom art exists not for art's sake but in the exploration and service of human life.

Computer Science and Applied Mathematics: Data Structures: Theory and Practice focuses on the processes, methodologies, principles, and approaches involved in data structures, including algorithms, decision trees, Boolean functions, lattices, and matrices. The book first offers information on set theory, functions, and relations, and graph theory. Discussions focus on linear formulas of digraphs, isomorphism of digraphs, basic definitions in the theory of digraphs, Boolean functions and forms, lattices, indexed sets, algebra of sets, and order pair and related concepts. The text then examines strings, trees, and paths and cycles in digraphs. Topics include algebra of strings, Markov algorithms, algebraic structures, languages and grammars, decision trees and decision tables, trees as grammatic markers, shortest path problems, and representation of prefix formulas. The publication ponders on digraphs of programs, arrays, pushdown stores, lists, and list structures, and organization of files. Concerns include scatter storage techniques, files and secondary storage, representation of digraphs as list structures,

storage of arrays, and sparse matrices. The text is a valuable reference for computer science experts, mathematicians, and researchers interested in data structures.

The Biography of a Novelist

Algebra 1: Explorations and Applications

Reading George Eliot's work was described by one Victorian critic as like the feeling of entering the confessional in which the novelist sees and hears all the secrets of human psychology—'that roar which lies on the other side of silence'. This new biography of George Eliot goes beyond the much-told story of her life. It gives an account of what it means to become a novelist, and to think like a novelist: in particular a realist novelist for whom art exists not for art's sake but in the exploration and service of human life. It shows the formation and the workings of George Eliot's mind as it plays into her creation of some of the greatest novels of the Victorian era. When at the age of 37 Marian Evans became George Eliot, this change followed long mental preparation and personal suffering. During this time she related her power of intelligence to her capacity for feeling: discovering that her thinking and her art had to combine both. That was the great ambition of her novels—not to be mere pastimes or fictions but experiments in life and helps in living, through the deepest account of human complexity available.
