

Arabic Version Of Beck Depression Inventory

Based on decades of theory, research, and practice, this seminal book presents a detailed and comprehensive review, evaluation, and integration of the scientific and empirical research relevant to Aaron T. Beck's cognitive theory and therapy of depression. Since its emergence in the early 1960s, Beck's cognitive perspective has become one of the most influential and well-researched psychological theories of depression. Over 900 scientific and scholarly references are contained in the present volume, providing the most current and exhaustive evaluation of the scientific status of the cognitive theory of depression. Though the application of cognitive therapy has been well documented in the publication of treatment manuals, the cognitive theory of depression has not been presented in a unified manner until the publication of this book. Coauthored by the father of cognitive therapy, *Scientific Foundations of Cognitive Theory and Therapy of Depression* offers the most complete and authoritative account of Beck's theory of depression since the publication of *Depression: Causes and Treatment* in 1967. Through its elaboration of recent theoretical developments in cognitive theory and its review of contemporary cognitive-clinical research, the book represents the current state of the art in cognitive approaches to depression. As a result of its critical examination of cognitive-clinical research and experimental information processing, the authors offer many insights into the future direction for research on the cognitive basis of depression. The first half of the book focuses on a presentation of the clinical phenomena of depression and the current version of cognitive theory. After outlining important questions that have been raised with the diagnosis of depression, the book then traces the historical development of Beck's cognitive theory and therapy through the 1960s and '70s. It presents the theoretical assumptions of the model and offers a detailed account of the most current version of the cognitive formulation of depression. The second half of the book provides an in-depth analysis of the empirical status of the descriptive and vulnerability hypotheses of the cognitive model. Drawing on over three decades of research, the book delves into the scientific basis of numerous hypotheses derived from cognitive theory, including negativity, exclusivity, content specificity, primacy, universality, severity/persistence, selective processing, schema activation, primal processing, stability, diathesis-stress, symptom specificity, and differential treatment responsiveness. "In 1967 the first detailed description of the cognitive theory of depression was published in *Depression: Causes and Treatment* by one of us, Aaron T. Beck. The basic concepts of the theory laid out in that volume still provide the foundation for the cognitive model 30 years later. As well the first systematic investigations of the theory described in the 1967 volume contributed to a paradigmatic shift in theory, research, and treatment of depression that resulted in a very vigorous and widespread research initiative on the cognitive basis of depression. The present book is intended to provide a comprehensive and critical update of the developments in cognitive theory and research on depression that have occurred since the initial publication in the 1960s."--David A. Clark, from the Preface.

Psychiatric clinicians should use rating scales and questionnaires often, for they not only facilitate targeted diagnoses and treatment; they also facilitate links to empirical literature and systematize the entire process of management. Clinically oriented and highly practical, the *Handbook of Clinical Rating Scales and Assessment in Psychiatry and Mental Health* is an ideal tool for the busy psychiatrist, clinical psychologist, family physician, or social worker. In this groundbreaking text, leading researchers provide reviews of the most commonly used outcome and screening measures for the major psychiatric diagnoses and treatment scenarios. The full range of psychiatric disorders are covered in brief but thorough chapters, each of which provides a concise review of measurement issues related to the relevant condition, along with recommendations on which dimensions to measure - and when. The Handbook also includes ready-to-photocopy versions of the most popular, valid, and reliable scales and checklists, along with scoring keys and links to websites containing on-line versions. Moreover, the Handbook describes well known, structured, diagnostic interviews and the specialized training requirements for each. It also includes details of popular psychological tests (such as neuropsychological, personality, and projective tests), along with practical guidelines on when to request psychological testing, how to discuss the case with the assessment consultant and how to integrate information from the final testing report into treatment. Focused and immensely useful, the *Handbook of Clinical Rating Scales and Assessment in Psychiatry and Mental Health* is an invaluable resource for all clinicians who care for patients with psychiatric disorders.

Serotonin is one of the oldest neurotransmitters in evolutionary terms, and the serotonergic system is complex and multifaceted. Serotonin-producing neurons in the raphe nuclei provide serotonin innervations throughout various parts of the brain, modulating cellular excitability and network properties of targeted brain areas, and regulating mood, cognition and behavior. Dysfunctions of the serotonergic system are implicated in neuropsychiatric disorders including depression, schizophrenia, and drug abuse. Although the system has been studied for many years, an integrative account of its functions and computational principles remains elusive. This is partly attributed to the high variability and heterogeneity in terms of neuronal properties and receptor types, and its extensive connections with other brain regions. This *Frontiers Research Topic e-book* is a collection of recent experimental and computational work and approaches at multiple scales that provide the latest information regarding the integrated functions of the serotonergic system. The contributed papers include

a variety of experimental and computational work, and human clinical studies.

Textbook of Palliative Medicine provides an alternative, truly international approach to this rapidly growing specialty. This textbook fills a niche with its evidence-based, multi-professional approach and global perspective ensured by the international team of editors and contributing authors. In the absence of an international curriculum for the study of palliative medicine, this textbook provides essential guidance for those both embarking upon a career in palliative medicine or already established in the field, and the structure and content have been constructed very much with this in mind. With an emphasis on providing a service anywhere in the world, including the important issue of palliative care in the developing nations, Textbook of Palliative Medicine offers a genuine alternative to the narrative approach of its competitors, and is an ideal complement to them. Eye Movement Desensitization Reprocessing (EMDR) therapy is an evidence-based psychotherapy which has been recognized by the World Health Organization (WHO) as a first-choice treatment for Posttraumatic Stress Disorder (PTSD). Beyond PTSD, there has been increasing research into its mechanism of action and in the efficacy of EMDR in other psychiatric and somatic disorders with comorbid psychological trauma. The motivation of this research topic was to offer new and innovative research on EMDR across the globe to an increasing number of clinicians and researchers with an interest in this trauma-focused intervention.

Cultural Diversity in Neuropsychological Assessment provides a platform for clinical neuropsychologists, psychologists, and trainees to bridge cultures and speak to each other about the ethnically diverse communities they serve throughout the world. It allows readers to peek into their clinical filing cabinets and examine how they worked with diverse individuals from indigenous and migrant communities of Arab, Asian, European, Israeli, Latin American and Caribbean, Persian, Russian, Sub-Saharan African, and North American origin. The book first reviews important foundations for working with diverse communities that include key knowledge, awareness, skills, and action orientation. It then provides a collection of cases for each cultural geographic region. Each section begins with an introductory chapter to provide a bird's eye view of the historical and current state of clinical and research practice of neuropsychology in that region. Then, each chapter focuses on a specific community by providing surface and deep-level cultural background knowledge from the authors' unique perspectives. A case study is then covered in depth to practically showcase an evaluation with someone from that community. This is followed by a summary of key strategic points, lessons learned, references, further readings, and a glossary of culture specific terminology used throughout the chapter. In the end, the appendix provides a list of culturally relevant tests and norms for some communities. This ground-breaking peer-reviewed handbook provides an invaluable clinical

resource for neuropsychologists, psychologists, and trainees. It increases self-reflection about multicultural awareness and knowledge, highlights practical ways to increase cultural understanding in neuropsychological and psychological assessments, and sparks further discussion for professional and personal growth in this area.

Despite general agreement that psychosocial factors play an important role in various facets of the etiology, onset, treatment response and outcome of depressive disorders, the replicability of research results has left much to be desired. Because much of this unreliability has been attributed to variability in diagnostic criteria, this volume focuses on efforts to identify sources of variability in the definition and diagnosis of depressive disorders within Western society and cross-culturally. It also explicates the elusive role of aversive life events in the development and course of depressive disorders, deals with the interpersonal experiences and dispositions related to the vulnerability and maintenance of depression, and addresses an often neglected issue: how stress and social support affect the quality and response to treatment received. The text concludes with the presentation of an integrative framework for vulnerability to recurrent depressions which emphasizes the interaction of biological and psychosocial factors as largely mediated by personality and temperament. Incorporating the latest developments in pharmacology and therapy, this fully revised Second Edition is an ideal quick reference for those who prescribe psychotropic drugs for young people. New and notable features include: discussions of new drugs and health supplements; revised diagnostic terminology that accords with current DSM-IV nomenclature; reports on anti-epileptic medications; guidelines for the appropriate use of psychoactive medications; and instruction on the monitoring of physical, behavioral, and cognitive effects of various drugs. The handy spiral format makes the book easy to use.

The Handbook of Arab American Psychology is the first major publication to comprehensively discuss the Arab American ethnic group from a lens that is primarily psychological. This edited book contains a comprehensive review of the cutting-edge research related to Arab Americans and offers a critical analysis regarding the methodologies and applications of the scholarly literature. It is a landmark text for both multicultural psychology as well as for Arab American scholarship. Considering the post 9/11 socio-political context in which Arab Americans are under ongoing scrutiny and attention, as well as numerous misunderstandings and biases against this group, this text is timely and essential. Chapters in the Handbook of Arab American Psychology highlight the most substantial areas of psychological research with this population, relevant to diverse sub-disciplines including cultural, social, developmental, counseling/clinical, health, and community psychologies. Chapters also include content that intersect with related fields such as sociology, American studies, cultural/ethnic studies, social work, and public health. The chapters are written by distinguished scholars who merge their expertise with a review of the empirical data in order to provide the most updated presentation of scholarship about this population. The Handbook of Arab American Psychology offers a noteworthy contribution to the field of multicultural psychology and joins references on other racial/ethnic minority groups, including Handbook of African American Psychology, Handbook of Asian American Psychology, Handbook of U.S. Latino Psychology, and The Handbook of Chicana/o Psychology and Mental Health.

Designed to serve as a guidebook that provides a comprehensive overview of the essential aspects of neuropsychological assessment practice. Also intended as a comprehensive sourcebook of critical reviews of major neuropsychological assessment tools for the use by practicing clinicians and researchers. Written in a comprehensive, easy-to-read reference format, and based on exhaustive review of research literature in neuropsychology, neurology, psychology, and related disciplines, the book covers topics such as basic aspects of neuropsychological assessment as well as the theoretical background, norms, and the utility, reliability, and validity of neuropsychological tests.

Over a century ago, psychologists who were fascinated with religion began to study and write about it. Theologians and religious practitioners have responded to this literature, producing a fascinating dialogue that deals with our fundamental understandings about the human person and our place in the world. This book provides an introduction to the important conversations that have developed out of these interchanges. The dialogue between psychology and religion is difficult to study for a number of reasons. First, it requires knowledge of both psychology and religion. People with a background in psychology often lack a solid understanding of the religious traditions they wish to study, and theologians may not be up to date on the latest developments in psychology. Second, it requires conceptual tools to organize the material and understand the basic problems involved in any attempt to connect the science of psychology with religion. These concepts can be found in many places, for instance in the writings of philosophers of science, but they are complex and often hard to follow for those without a proper theological and philosophical background. Finally, authors who write on the topic come to the study of psychology and religion from a variety of academic and personal backgrounds. This makes for wonderful diversity in conversations, but it makes understanding and mastery of the material quite difficult.

Background: Depression is a major public health problem worldwide. It is estimated that 350 million individuals around the world are affected by depression. Depression is known to be more prevalent in women than men. Several social, economic, biological, behavioral, psychosocial, and health-related factors have been identified as predictors of depression in women worldwide. However, whether or not these factors have similar effects on Omani Arab women, and the mechanism of their effects on depression among adult Omani women have not been well examined. Aims: This study focuses on assessing predictors of depression among adult Omani women, including socioeconomic status (SES), material circumstances, bio-behavioral, psychosocial, and health care system factors, as well as age. Moreover, this study examined the utility of the revised Social Determinant of Health (rSDH) conceptual model in assessing the predictors of depression in the targeted population. Method: A cross-sectional study was conducted involving 240 adult women, 18-72 years old from urban and rural areas of Wilayat (province) of Rustaq. An Arabic version of the Beck Depression Inventory (BDI-II) scale was used to assess depression scores. A bivariate analytical model was used to identify correlations between each independent variable and depression in adult Omani women. Path analysis using Partial Least Square Structural Equation Modeling (PLS-SEM) was used to test the effects of factors within the conceptual model (rSDH), the mediator effects of latent variables between SES and depression, and the effect of age as a moderator of the association between SES and depression. Results: Fifty-two of the participants (21.7%) were found to be depressed. Of all participants, 12.5% were mildly depressed, 6.7% were moderately depressed, and 2.5% were severely depressed. Depression scores were significantly correlated with education level, employment, place of residence, number of children, domestic violence, social

support, coping strategies, seeking professional help, comfort level regarding talking to a health care professional, perceived stigma, and age. Path analysis results showed that the examined factors explained a variance of 62% on the dependent variable (depression scores). Moreover, path analysis through PLS-SEM indicated that the bio-behavioral latent variable is the significant mediator of the association between SES and depression. Age was not a significant moderator of the association between SES and depression. Conclusion: Depression scores are high among adult Omani women and different factors were linked to higher levels of depression among those women. It will be important to consider socioeconomic, bio-behavioral, psychosocial, and health care system factors, as well as material circumstances, that may all impact the mental and emotional health of Omani women. This study is a step towards exploring predictors of an important mental disease as well as developing cost-effective prevention, promotion, and management programs to address the mental and emotional needs of adult Omani women.

Measurement is an important concern for the progress of psychology, both as a basic science and as a field of application. The development of psychological research and practice would not be possible without sound assessment and measuring procedures. This book presents a collection of personality and psychopathology scales, developed originally in Arabic and translated into English, since self-reports and questionnaires play a prominent role in psychological research and practice, as they are simple and cost less than other methods of assessment. Furthermore, these scales are suitable in surveys and epidemiological studies with large samples. This book will be useful in different disciplines such as psychology, psychiatry, epidemiology, gerontology, social work, and social sciences.

This 2-volume set focuses on adolescent health in the Middle East and North Africa region (MENA), and presents the latest research on the health risk behaviours and social behaviours that adolescents from the MENA region engage in. While there has been a surge in peer-reviewed research publications on population health in the MENA region in the last couple of decades, very few books offer a resource to address the diverse negative influences that disproportionately affect adolescents and children in the MENA region, including increased tobacco consumption culture, low emphasis on physical activity, increased sedentary behaviours, weak health policies, and societal issues related to displacement and political conflicts. These books offer a synthesis of current knowledge on adolescent health issues in the MENA region, and aim to provide evidence-informed adolescent health care practices that address current issues related to mental, physical, reproductive and nutritional health. Volume 1 focuses on mental health in the MENA region, the development and implementation of youth friendly public policies, and how to strategize in the age of COVID-19. The study will aid health care professionals, policy makers, government organizations and health program planners to assess current policies and practices related to adolescent health in the MENA region, and to identify the best courses of action moving forward.

"This life changing book helps readers use cognitive-behavioral therapy - one of today's most effective forms of psychotherapy - to conquer depression, anxiety, panic attacks, anger, guilt, shame, low self-esteem, eating disorders, substance abuse, and relationship problems. The second edition contains numerous new features : expanded content on anxiety ; chapters on setting personal goals and maintaining progress ; happiness rating scales ; gratitude journals ; innovative exercises focused on mindfulness, acceptance, and forgiveness; new worksheets ; and much more."--Publisher.

Al-Balkhi explains symptoms and treatments giving advice on preventive measures and how to return the body and soul to their natural healthy

state. In doing so he displays a keen understanding of the human condition and the medical nature of the human emotional state. An astonishing feat given that many of the conditions he discusses were left largely unknown and untreated for centuries before being clinically defined as such, only as relatively recently as the 20th century. A genius, his insights on human psychopathology as well as diagnoses of psychological ailments including stress, depression, fear and anxiety, phobic and obsessive-compulsive disorders, together with their treatment by cognitive behavior therapy, relate to us in every way and are in sync with modern psychology. Importantly, they also incorporate a greater dimension to include the soul and the worship of God.

Love and depression are key elements in the cultural script of emotions or affectual life within contemporary Western society, and the two have become intertwined to such an extent that it is informative to talk about depressive love. Indeed, the most common source of depression is intimate relationships, in which one partner is not recognised by the other as being in need or worthy of loving care. This book addresses the question of how it is possible for opposite emotional experiences such as love and depression to appear simultaneously, empirically documenting the phenomenon of depressive love and its implications through studies of art, including music, literature and photography, and the experiences of everyday life, by way of interviews and the analysis of e-mail-, sms-, messenger-correspondence, and other new media spaces. Engaging with a range of sociological, psychoanalytic and philosophical theories of love, depression and emotion, including the work of Simmel, Alberoni, Barthes, Hochschild, Giddens, Luhmann, Beck and Beck-Gernsheim, Illouz, Bauman, Hegel, Honneth, Ehrenberg, Han, Lévinas, Sartre, Freud, Lacan, and Kristeva, to name but a few, the author examines the ways in which depressive love is expressed in modern society, asking whether it is a new phenomenon and confined to the West and if not, what is distinctive about depressive love and its associated (dys)functions in contemporary Western society. An empirically rich and theoretically broad study of depressive love as a sign of our times, this book will appeal to scholars and students of social theory and the sociology and philosophy of emotion and interpersonal relationships.

Persons of Arab (North African/ Middle Eastern) descent have faced unique psychosocial stressors due to the socio-political backlash following the World Trade Center attacks. These are compounded by traditional acculturation challenges, leading to increased psychological distress. This study satisfies an urgent need to better understand the acculturation and mental health experiences of Arab Americans by comprehensively and rigorously investigating hypotheses introduced in the previous literature. Participants were 611 Arab Americans from 35 U.S. states who completed a secure Internet form. Variables assessed were: acculturation (Vancouver Index of Acculturation- Modified Arab Version), acculturative stress (SAFE Acculturation Stress Scale- Revised; included issues of discrimination and American foreign policy), family functioning (Family Assessment Device-General Functioning Subscale), social support (Personal Resource Questionnaire85- Revised), religious coping (Brief Arab Religious Coping Scale), anxiety (Beck Anxiety Inventory), depression (Center for Epidemiologic Studies- Depression Scale), and a socio-demographics survey. Seven research foci were examined. First, 13 socio-demographic indexes hypothesized to relate to acculturation (including SES, generation status, length of residence in the U.S., English vs. Arabic language use, and Arabic TV viewing) were found to relate to American identity in the expected directions, while most indexes did not relate to Arab identity. Second, participants reported significantly higher anxiety and depression compared to normative samples and studies with other ethnic minority groups. Third, as hypothesized, integrated and assimilated individuals reported less stress, anxiety, and depression compared to those who were separated or marginalized. Fourth, as hypothesized, acculturation stress correlated with anxiety and depression, and both family functioning and social support related to less stress and less psychological distress. However, religious coping did not correlate with mental health. Fifth, contrary to the hypotheses, females did not demonstrate greater stress or psychological distress compared to males. Consistent with hypotheses, Christians demonstrated significantly less acculturative stress, anxiety, and depression compared to Muslims. Finally, structural equation modeling was used to develop a tenable model that explained the complex interactions among SES, acculturation, stress, mental health, and coping resources. Specific and practical recommendations are provided for clinical intervention, community programming and policy planning, and future research.

Throughout the history of humanity, religion has played an important role as one of the most powerful forces of life, death, health and disease. In psychology, interest in the study of religion dates back around one and a half centuries. This interest has been driven, in large part, by the findings of a positive relationship between religiosity and physical and mental health, subjective well-being, happiness and longevity. Furthermore, religiosity is now a subject in many disciplines such as medicine, psychiatry, sociology, anthropology, education, epidemiology, gerontology, social work, and psychotherapy. This book brings together in one volume the scattered studies of religiosity and subjective well-being carried out in different Arab, mainly Muslim, countries. The vast majority of these articles are empirical research papers, and are classified into six sections: namely, Islam and Mental Health; Psychometric Measures; Religiosity, Health and Happiness; Religiosity, Quality of Life and Subjective Well-Being; Religiosity and Personality; and Religiosity, Subjective Well-Being and Psychopathology.

Currently, informatics within the field of public health is a developing and growing industry. Clinical informatics are used in direct patient care by supplying medical practitioners with information used to develop a care plan. Intelligent applications in clinical informatics facilitates with the technology-based solutions to analyze data or medical images and help clinicians to retrieve that information. Decision models aid with making complex decisions especially in uncertain situations. The Handbook of Research on Applied Intelligence for Health and Clinical Informatics is a comprehensive reference book that focuses on the study of resources and methods for the management of healthcare infrastructure and information. This book provides insights on how applied intelligence with deep experiential learning, and more will impact healthcare and clinical information processing. The content explores the representation, processing, and communication of clinical information in naturally engineered systems. This book covers a range of topics including applied intelligence, medical imaging, telehealth, and decision support systems, and also looks at technologies and tools used in the detection and diagnosis of medical conditions such as cancers, diabetes, heart disease, lung disease, and prenatal syndromes. It is an essential reference source for diagnosticians, medical professionals, imaging specialists, data specialists, IT consultants, medical technologists, academicians, researchers, industrial experts, scientists, and students.

Arab American Mental Health in the Post September 11 Era

This evidence-to-practice volume deftly analyzes the processes and skills of integrating mental healthcare with primary care, using multiple perspectives to address challenges that often derail

these joint efforts. Experts across integrative medicine offer accessible blueprints for smoothly implementing data-based behavioral interventions, from disease management strategies to treatment of psychological problems, into patient-centered, cost-effective integrated care. Coverage highlights training and technology issues, key healthcare constructs that often get lost in translation, and other knowledge necessary to create systems that are rooted in—and contribute to—a robust evidence base. Contributors also provide step-by-step guidelines for integrating behavioral health care delivery in treating cancer, dementia, and chronic pain. Among the topics covered: The epidemiology of medical diseases and associated behavioral risk factors. Provider training: recognizing the relevance of behavioral medicine and the importance of behavioral health consultations and referrals. Screening for behavioral health problems in adult primary care. Health care transformation: the electronic health record. Meeting the care needs of patients with multiple medical conditions. Smoking cessation in the context of integrated care. This depth of clinical guidance makes Behavioral Medicine and Integrated Care an essential reference for practitioners on all sides of the equation, including health psychologists and other professionals in health promotion, disease prevention, psychotherapy and counseling, and primary care medicine.
