The field of nanoscience continues to grow at an impressive rate and, with such a vast landscape of material, careful distillation of the most important discoveries will help researchers find the key information they require. Nanoscience Volume 5 provides a critical and comprehensive assessment of the most recent research and opinion from across the globe. Coverage includes diverse topics such as controlling chemistry of gold nanoparticles to dictate their cellular interactions, uptake and toxicity, use of metal complexes to prepare 2-D materials and nanoscale porphyrin superstructures. Anyone practising in any nano-allied field, or wishing to enter the nano-world will benefit from this resource, presenting the current thought and applications of nanoscience.

Women's Menstruation Log Whether you call it your monthly visitor, period, red days or one of many other creative euphemisms, menstruation is a mainstay in most women's lives from early adolescence until menopause. Magnesium remains almost unique among the metals in its ability to react directly with a wide variety of compounds. This organic chemistry field has seen steady progress, and a volume on this topic is long overdue. In the tradition of the Patai Series this title treats all aspects of functional groups, containing chapters on the theoretical and computational foundations; on analytical and spectroscopic aspects with dedicated chapters on Mass Spectrometry, NMR, IR/UV, etc.; on reaction mechanisms; on applications in syntheses. Depending on the functional group there are also chapters on industrial use, on effects in biological and/or environmental systems. Since the area of Organomagnesium Chemistry continues to grow far beyond the classical Grignard Reagents, this is an essential resource to help the reader keep abreast of the latest developments.

Wealthy Me Goldsbrough presents Sydney's charming Darling Harbour and the surroundings within walking distance, accompanied with a brief history of the area and inspirational quotes from Baha'i writings, the Bible, Buddha, Eastern and Western philosophers, scientists and writers. It showcases apartments hosted by Minh Hien and Farshid within an architecturally renovated historic Goldsbrough building through colourful photos and provides practical guide.

The Rosetta Stone is one of the most popular artefacts in the British Museum. Containing a decree written in Greek, Demotic and hieroglyphics, it proved to be the key to deciphering Egyptian hieroglyphics. This concise study traces the history of 'the most famous piece of rock in the world' to become a modern icon and tells the story of the race to use it to decipher Egypt's ancient script by Jean-François Champollion and Thomas Young. Also includes a translation of the text.

This intensely interesting—and troubling—book is the product of a lifetime of reflection and study of democracy. In it, John Lukacs addresses the questions of how our democracy has changed and why we have become vulnerable to the shallowest possible demagoguery. Lukacs contrasts the political systems, movements, and ideologies that have bedeviled the twentieth century: democracy, Liberalism, nationalism, fascism, Bolshevism, National Socialism, populism. Reflecting on American democracy, Lukacs describes its evolution from the eighteenth century to its current form—a dangerous and possibly irreversible populism. This involves, among other things, the predominance of popular sentiment over what used to be public opinion. This devolution has happened through the gigantic machinery of publicity, substituting propaganda—and entertainment—for knowledge, and ideology for a sense of history. It is a kind of populism that relies on nationalism and militarism to hold society together. Lukacs's observations are original, biting, timely, sure to inspire lively debate about the precarious state of American democracy today.

Adventures in Egypt and Nubia tells the story of the pioneer Egyptologist William John Bankes (1786-1855). A brilliant and volatile man, Bankes was the unexpected heir of the Kingston Lacy estate in Dorset, whose passion for exploration and discovery was surpassed only by his energy in investigating and recording. Handsome, rich, and confident, Bankes studied at Trinity College, Cambridge, where he met Byron who became a lifelong friend, before setting out on the Grand Tour. A period spent in Spain and Portugal was followed by travels in the Near East, where a chance encounter with the Swiss explorer J. L. Burckhardt would inspire Bankes with a desire for serious archaeological research, far beyond the more leisurely pursuits of the average gentleman-traveller. During the years 1815-19 Bankes criss-crossed Egypt and the Near East amassing a vast portfolio of notes and manuscripts, as well as drawings by his own hand and the artists who accompanied him on his novels. The accuracy and detail of Bankes's collection makes it an invaluable record of ancient monuments now lost or damaged. His extraordinary discoveries were a revelation to contemporary scholars and proved instrumental in the race to decipher Egyptian hieroglyphics.

Current successes in omics research have accelerated the production of high quality foods. Various mutation methodologies have been developed to achieve this progress, showing the importance of mutagenesis for food security. 'Mutagenesis: exploring novel genes and pathways' describes the latest achievements in induced mutagenesis, with a particular focus on the development of crops. The book details experimental studies on functions of particular genes of interest, the mechanisms involved in physiological processes, and occurring chemical reactions. Also, the creation of new mutants and lines by use of genomic data banks is discussed. The book will be of mutual interest to end-users in modern breeding programs as well as to scientific research.

This reference examines the cellular, molecular, and genetic mechanisms involved in airway inflammation, as well as the pathophysiology, epidemiology, and aetiology of asthma. It explores strategies to prevent cellular injury and oxidative tissue damage, inhibit key inflammatory pathways and identify disease-specific targets to reduce the induction

Genetic variability is an important parameter for plant breeders in any conventional crop improvement programme. Very often the desired variation is unavailable in the right combination, or simply does not exist at all. However, plant breeders have successfully recombined the desired genes from cultivated crop germplasm and related wild species by sexual hybridization, and have been able to develop new cultivars with desirable agronomic traits, such as high yield, disease, pest, and drought resistance. So far, conventional breeding methods have managed to feed the world's ever-growing population.

Continued population growth, no further scope of expanding arable land, soil degradation, environmental pollution and global warming are causes of concern to plant biologists and planners. Plant breeders are under continuous pressure to improve and develop new cultivars for sustainable food production. However, it takes several years to develop a new cultivar. Therefore, they have to look for new technologies, which could be combined with conventional methods to create more genetic variability, and reduce the time in developing new cultivars, with early-maturity, and improved yield. The first report

on induced mutation of a gene by HJ. Muller in 1927 was a major milestone in enhancing variation, and also indicated the potential applications of mutagenesis in plant improvement. Radiation sources, such as X-rays, gamma rays and fast neutrons, and chemical mutagens (e. g. , ethyl methane sulphonate) have been widely used to induce mutations.
