*As arts therapists are increasingly working in schools, there is growing interest in identifying applicable therapeutic approaches and expanding on relevant research evidence. This book outlines the potential uses of music, art, drama and dance movement therapies in educational settings, and the contribution they have to make to the emotional and social development of children and adolescents. Drawing on international evidence, the book outlines a wide range of innovative applications of arts therapies across a range of settings, including mainstream classrooms, special schools and student support units. Examples of subjects covered include solution-focused brief dramatherapy groupwork in mainstream education, art therapy for children with specific learning difficulties who have experienced trauma and music therapy in special education. Particular emphasis is placed upon collaborative work, whether it be between arts therapists from different disciplines, arts therapists and teaching staff or arts therapists and researchers. Arts Therapies in Schools will be of great interest to arts therapists, and will also be useful to others who want to know about the potential of arts therapies in the classroom, including teachers and other education professionals, health professionals, educational psychologists, school counsellors and*

*From concerns about an ‘autism epidemic’ to the MMR vaccine crisis, autism is a source of peculiar fascination in the contemporary media. Author Stuart Murray, himself the parent of an autistic child, contends that for all the coverage, autism rarely emerges from the various images we produce of it as a comprehensible way of being in the world—instead occupying a succession of narrative spaces as a source of fascination and wonder. A refreshing analysis and evaluation of autism within contemporary society and culture, Representing Autism establishes the autistic presence as a way by which we might more fully articulate our understanding of those with the condition, and what it means to be a human.*

*Parents of young children newly diagnosed as on the autism spectrum are often at a loss for ideas about how best to help their child. They feel dismayed and 'shut out' by their child and are often also having to grapple with language and behaviour problems. Playing, Laughing and Learning with Children on the Autism Spectrum is not just a collection of play ideas; it shows how to break down activities into manageable stages, and looks at ways to gain a child's attention and motivation and to build on small achievements. The use of case studies illustrates how problems of ritual and obsession can be used and redirected positively and shows how to structure play activities and overcome communication barriers by using picture cards. Each chapter covers a collection of ideas around a theme, including music, art,*

They describe the challenges they faced in establishing and running an Integrated Resource for these children within a mainstream secondary school. The twenty-four pupils at The Resource participate in the regular school curriculum, but also learn a wide range of additional life skills. Using extensive examples from practice with a range of client groups, *Dramatherapy and Autism* confronts the assumption that people with autism are not able to function within the metaphorical realms of the imagination and creativity. It demonstrates that not only are people who function along the spectrum capable of engaging in creative exploration, but that through encountering these processes in the clinical context of dramatherapy, changes can be made that are life enhancing. Bringing in cutting-edge research and practice on dramatherapy, *Dramatherapy and Autism* aims to contribute to developing the theory and practice of creative arts therapies interventions with clients with autism. our best. These methods are, by-and-large, successful in everyday situations.

However, when it comes to more difficult aspects of developing skills in our children, we need something more dependable than good will. Applied Behaviour Analysis (ABA), the systematic implementation of scientifically proven behavioural principles offers just that. Aimed at enhancing people's lives in ways that they or their carers feel are important, it includes a variety of methods and techniques which can be used to promote, decrease, or maintain skills for daily living. ABA has been used to help children with autism for many years in many countries. In Northern Ireland the PEAT group offers parents the education necessary to become their own child's therapists using ABA. In this book these parents and the professionals involved in their training share their knowledge, experience, and successes.

Doing Practitioner Research Differently encourages those embarking on practitioner research to consider the validity of innovative methods and styles of reporting. The book looks at three methods of enquiry and reporting - visualisation, conversation and fictional writing. Using practitioners' own accounts and research reports as case studies, this book explores the reasons why some practitioners reject the traditional research methods. It looks at the challenges faced by these practitioners and the conditions in higher education that encourage or inhibit innovative practitioner research. The case studies used illustrate that there are modes of enquiry and reporting that can foster the development of professional thinking and practice.

Donna Williams' challenging book, written by an autistic person for people with autism and related disorders, carers, and the professionals who work with them, is a practical handbook to understanding, living with and working with autism. Exploring autism from the inside, it shows clearly how the behaviours associated with autism can have a range of different causes, and in many cases reflect the autistic person's attempt to gain control over their internal world. The sensory and perceptual problems that challenge a person with

autism are described in depth, together with strategies for tackling them so as to enable that person to take more control of their lives. Donna Williams comments on the various approaches to autism, drawing out those strategies that are of real use, and explaining why some approaches may prove counterproductive, leaving the autistic person feeling even more isolated and misunderstood.

Taking the view that understanding autism is the key to managing the condition, Donna Williams' book will bring illumination to all those who have felt baffled and frustrated by the outside appearance of autism. It contains a wealth of helpful suggestions, insights and new ideas, exploding old myths and promoting a view that all those involved with autism will find empowering and creative.

Autism Spectrum Disorders (ASD) is portrayed as cognitive and social disorders. Undoubtedly, impairments in communication and restricted-repetitive behaviors that now define the disorders have a profound impact on social interactions. But can we go beyond the descriptive, observational nature of this definition and objectively measure that amalgamate of motions and sensations that we call behavior? In this Research Topic we bring movement and its sensation to the forefront of autism research, diagnosis, and treatment. We gather researchers across disciplines with the unifying goal of recognizing movement and sensory disturbances as core symptoms of the disorder. We also hear confirmation from the perspective of autism self-advocates and parents. Those important sources of evidence along with the research presented in this topic demonstrate without a doubt that profound movement and sensory differences do exist in ASD and that they are quantifiable. The work presented in this Research Topic shows us that quantifiable differences in movements have a better chance than current observational techniques to help us uncover subtle solutions that the nervous system with autism has already spontaneously self-discovered and utilized in daily living. Where the naked eye would miss the unique subtleties that help each individual cope, instrumentation and fine kinematic analyses of motions help us uncover inherent capacities and predispositions of the person with autism. The work presented in this topic helps us better articulate through the voices of parents and self-advocates those sensory motor differences that current inventories could not possibly uncover. These differences are seldom perceived

as they take place at timescales and frequencies that fall largely beneath our conscious awareness. To the person in the spectrum living with this disorder and to the caregiver creating accommodations to help the affected loved one, these subtleties are very familiar though. Indeed they are often used in clever ways to facilitate daily routines. We have waited much too long in science to listen to the very people that we are trying to define, understand and help. Being autism a social problem by definition, it is remarkable that not a single diagnosis inventory measures the dyadic social interaction that takes place between the examiner and the examinees. Indeed we have conceived the autistic person within a social context where we are incapable –by definition– of accepting those differences. The burden is rather placed on the affected person to whom much too often we refer to in the third person as “non-verbal, without intentionality, without empathy or emotions, without a theory of mind”, among other purely psychological guesses. It is then too easy and shockingly allowed to “reshape” that person, to mold that person to better conform to our social expectations and to extinguish “behaviors” that are socially unacceptable, even through the use of aversive punishing reinforcement techniques if need be. And yet none of those techniques have had a single shred of objective scientific evidence of their effectiveness. We have not objectively measured once, nor have we physiologically characterized once any of those perceived features that we so often use to observationally define what we may think the autistic phenotype may be. We have not properly quantified, beyond paper-and-pencil methods, the effectiveness of interventions in autism. Let us not forget when we do our science, that we are all part of the broad human spectrum.

Anyone meeting a young child with autism for the first time will find this fully revised edition of a classic text invaluable. The authors provide parents and professionals with an insight into the nature and educational implications of autism, particularly in very young children. In a clear and sensitive style the authors: outline the characteristics of autism as they present themselves in the early years; consider the nature of autism and the issues surrounding assessment and diagnosis; offer practical strategies for effective and realistic intervention both at home and in a variety of early years settings; suggest ways to promote learning, social development, communication and appropriate behaviour; explore possibilities for enhancing access to the early years curriculum. This updated second edition includes new material relating to new statutory requirements such as Every Child Matters and Disability Equality Duty, as well as updates to different approaches to autism, assessment and behavioural issues. The authors outline the principal themes and objectives of the Early Years Foundation Stage and the Inclusion Development Programme. *Autism in the Early Years: A Practical Guide (Second Edition)* provides accessible material, support and advice for parents, teachers and professionals who are working together in an unfamiliar area following early diagnoses of autism in young children. Exposure anxiety is increasingly understood as a crippling condition affecting a high proportion of people on the autism spectrum. Based on personal experience, this book describes the condition and its underlying physiological causes, and presents approaches and strategies that can be used to combat it.

spectrum conditions, Olga Bogdashina uses the concept of Theory of Mind (ToM) to consider these groups' different (and often conflicting) perspectives. ToM is the ability to imagine and make judgements about what others feel and think; its absence in autistic individuals is called 'mindblindness'. This book addresses the 'mindblindness' of people united in their interest in autism but divided by their different angles and perspectives. Divided into four parts, the book first defines autism, then the views of the three main groups working with it - autistic individuals, parents and professionals - under the headings of classifications, diagnosis, causes, development, theories and treatment. By comparing and reconciling the different perspectives in this way, the book helps each group to understand and predict each other's responses and behaviours. This enlightening and innovative book offers a unique way of 'stepping in each other's shoes' and is a valuable resource for all people living or working with autism.

Participatory Research Designs in Autism examines the impact that the interactive style of neurotypical individuals could have on the spontaneous communication of children with autism. This book provides clear and detailed guidance on how to conduct research into autism in real-world settings such as schools and homes. Kossyvaki critically evaluates a wealth of relevant case studies and focuses on a number of methodological issues that researchers are likely to face when carrying out research of this complex nature. The author walks the reader through present literature on the importance of spontaneous communication and the atypical way that this tends to develop in autism, before bringing the results of her own research to bear on the question of how the interactive styles of neurotypical individuals can impact on the spontaneous communication of people with autism. *Adult Interactive Style Intervention and Participatory Research Designs in Autism* is essential reading for academics, researchers, and postgraduate students in the fields of special educational needs, inclusion, autism, research methods, and educational and clinical psychology. **People on the autism spectrum often present with symptoms indicating poor self-awareness or hyper-awareness, low self-esteem, depression and difficulty connecting with others. Treatment which relies on medical and behavioural views of autism risks ignoring emotional factors. This book demonstrates that counselling and emotional support is not only possible for people on the autism spectrum, but essential. David Moat describes the impact of autism on emotional perception and regulation, and looks at how various therapeutic principles can helpfully be applied to address these issues. He identifies strategies for dealing with common emotional difficulties, including anxiety, anger**

and depression, as well as techniques for aiding relaxation. Specific approaches to use as part of holistic care are described, including play therapy, the use of imagery and story-making, hypnotherapy, intensive interaction, Neuro-Linguistic Programming, Cognitive Behavioural Therapy and positive psychology. This is essential reading for all those working therapeutically with people on the autism spectrum, including counsellors, therapists and psychologists, as well as parents.

Addressing the complex issue of what constitutes a communication enabling environment for children with autism who use little or no speech, Potter and Whittaker show that the communication of these children can be significantly affected by a range of social and environmental influences. As well as providing an overview of the theoretical issues involved, *Enabling Communication in Children with Autism* provides detailed practical advice. Key elements of the recommended approach include \* the use of minimal speech \* proximal communication \* the use of appropriate systems of communication including multipointing \* providing many and varied opportunities for communication. Arguing that encouraging spontaneous communication should be viewed as a major educational goal for these children, Potter and Whittaker demonstrate that these children can and do communicate in enabling environments and

**Recent research has shown that art therapy can be particularly effective for children with autism and related communication disorders. The extensive range of symptoms experienced by autistic people makes them extremely individual in presentation, so any treatment used must be tailored to a range of varying needs. Art Therapy with Children on the Autistic Spectrum presents a new model of practice, which primarily focuses on communication difficulties. The authors describe how negative behaviours and subsequent tension may be alleviated when the autistic child is involved in interactive art making with the therapist. The book is divided into three parts: the first part explores art making processes and art work, with an emphasis on how art can be specifically communicative. A history of autism is presented within the therapeutic context. The second part challenges existing methods of practice within art therapy and considers the most appropriate approaches to treating autistic children. The last part discusses research that led to the formulation of this specific model - methodology and assessment interventions are analysed, as well as the ongoing development of appropriate assessment instruments. **People with severe autism experience the sensory information they receive from the world completely differently to those not on the spectrum. They feel cut off and overwhelmed, and their behaviour can become very distressed. This handbook shows how we can engage with people who are non-verbal or semi-verbal and sometimes even those who have speech but lose the power to process it when they are in crisis. We can help them to make sense of the world. Intensive Interaction uses a person's own body language to make contact with them and Sensory Integration develops the capacity of an individual to receive, process and apply meaning to information provided by the senses through targeted physical activities. These techniques can be used to develop an environment tailored to the particular sensory needs of the person with severe autism, reducing factors that cause distress. practice of teaching and working with such pupils it should be read by teachers too' - Tess Coll, autism outreach teacher 'There can be no doubt that the action suggested by the authors to improve outcomes for pupils with ASD, would benefit the inclusion of all pupils' - Special Needs Information Press 'This book will be a really useful resource for those supporting children with ASDs in a range of schools, both special and mainstream. It uses case study material collected from experience and discussions with staff, to illustrate dilemmas and strategies. It encourages reflection on practice by posing questions at different points. The book also provides many useful references to published materials and websites for readers to follow up and suggests how support assistants can work to become part of the whole staff team' - Dr Glenys Jones, University of Birmingham Specifically designed to provide information and professional guidance for people working in educational support roles, this book focuses on the work carried out by Teaching Assistants in mainstream primary and secondary schools. The book will give them the tools and awareness to work confidently with pupils from across the autistic spectrum, whilst validating their position within a staff team. Using real-life case studies to illustrate common issues faced by support staff within any educational setting, it recognizes the often tough situations they find themselves in
