

Automatic Fire Detection And Alarm Systems

During 1968, local authority fire brigades in Great Britain were asked to participate in a survey that was intended to bring together (among other things) reports on all fires starting in premises equipped with automatic fire detection systems. All the reports received have been examined to establish, so far as possible, how often a fire occurred and either (a) there was a complete failure of the automatic system because it was not in

a serviceable condition (Total Failure); (b) there was a local alarm indication provided by the system, but a failure in the brigade connection because the connection was not in a serviceable condition (Brigade Connection Failure), (c) the system operated, or would have done if the fire had not been discovered at an early stage by a person. All reports on false alarms, or on fires in premises equipped with manual fire alarm systems or fixed installations such as sprinklers, have so far as possible been excluded.

Maintenance of Fire Protection Equipment

Automatic fire detection and alarm systems are effective and reliable means of detecting fires and signalling an alarm to occupants. This guide introduces these systems, explains how they are developed and managed, and the regulatory requirements.
