The study of orthopaedics and fractures is hugely important to every undergraduate medical student, and it is difficult finding the right textbook that will give them a sufficient level of knowledge and help them through their examinations. "Textbook of Orthopaedics" is just such a book, giving more than enough information, while at the same time focussing on the main goal - passing the orthopaedics exam. The book is divided into 8 sections, which deal with the obligatory, standard areas of study, such as general orthopaedics, regional injuries, and both traumatic and non-traumatic disorders. But there are also innovative sections which discuss amputations, prosthetics, sports medicine, arthroplasty and arthroscopy, and the final section of appendices gives information about orthopaedic implants and instrumentation in common use, as well as tips and hints for practical exam sessions. The book is very "student friendly" with numerous excellent pedagogical features - diagrams, end of chapter summaries, flow charts, mnemonics, differential shading of tables and columns, anecdotes, jokes, and historical references. X-rays are found at the end of each chapter and there is also a focus on back ache, a very common orthopaedic problem often neglected by other textbooks. In short "Textbook of Orthopaedics" is an exam-oriented textbook designed and written specifically for medical undergraduates.

Finding the right criteria to use when judging Complementary and Alternative Medicine (CAM) is essential if it is to stand up to criticism from those concerned about the importance of evidence-based medicine. This edited volume highlights how CAM requires different research tools and techniques from conventional medicine, and examines effective methodologies for accurately assessing CAM. Addressing a problem which is often cited as the reason for a failure to appreciate the potential in CAM approaches to patient care, experts from a wide array of CAM modalities suggest the most effective research methodology for each particular therapy and illustrate how a lack of adherence to that methodology produces a less effective assessment. Disciplines covered include Traditional Chinese Medicine, homeopathy, herbal medicine, craniosacral therapy, qigong and yoga. Providing direction in research and the best criteria to appropriately assess each discipline, this book highlights and responds to the issues underlying research in CAM. It will be of interest to anyone involved in CAM research, in addition to CAM practitioners and students, western medical practitioners looking to include CAM in their treatments, and anyone studying research design and methodology.
