MCQs are a vital support to medical and science students, both to measure developing knowledge in a discipline and to build confidence for examinations. Many undergraduate and postgraduate exams

coverage of a range of essential topics in the medical curriculum. Written and tested in consultation with students, each book offers a clear and accessible account of the core material, supported by case studies and clinical examples. Efforts have been made

This presentation describes various

Access Free Blood Physiology Mcq With Answers

aspects of the regulation of tissue oxygenation, including the roles of the circulatory system, respiratory system, and blood, the carrier of oxygen within these components of the cardiorespiratory system. The respiratory system takes oxygen from

Access Free
Blood Physiology
Mcq With Answers

the atmosphere and transports it by diffusion from the air in the alveoli to the blood flowing through the pulmonary capillaries. The cardiovascular system then moves the oxygenated blood from the heart to the microcirculation of

the various organs
by convection,
where oxygen is
released from
hemoglobin in the
red blood cells and
moves to the
parenchymal cells of
each tissue by
diffusion. Oxygen
that has diffused
into cells is then
utilized in the
mitochondria to

produce adenosine triphosphate (ATP), the energy currency of all cells. The mitochondria are able to produce ATP until the oxygen tension or PO_2 on the cell surface falls to a critical level of about 4–5 mm Hg. Thus, in order to meet the energetic needs of cells, it is

Access Free
Blood Physiology
Mcq With Answers

important to maintain a continuous supply of oxygen to the mitochondria at or above the critical PO_2 . In order to accomplish this desired outcome, the cardiorespiratory system, including the blood, must be capable of

regulation to ensure survival of all tissues under a wide range of circumstances. The purpose of this presentation is to provide basic information about the operation and regulation of the cardiovascular and respiratory systems, as well as the

properties of the blood and parenchymal cells, so that a fundamental understanding of the regulation of tissue oxygenation is achieved.
