A comprehensive introduction to statistics that teaches the fundamentals with real-life scenarios, and covers histograms, quartiles, probability, Bayes' theorem, predictions, approximations, random samples, and related topics.

George Osborn was born into a dysfunctional family. His father was an alcoholic and George got into drugs,

petty theft, and sex while still young. His involvement in occult practices made him feel completely controlled by spirits, to the point where he nearly lost his life under a train. Through an encounter with a local church youth club, George mended his ways for a time, but he lost interest and slid away from his Christian life. As a young adult, George was into getting high, having sex, and travelling the world, and Christ seemed very distant.

On his return to England, George, like a prodigal son, returned to his Christian commitment - and stayed. His story could be that of any young man in today's world, and is an honest, relevant account of the redemptive power of Christ.

The realm of theoretical physics is teeming with abstract and beautiful concepts. And the task of imagining them is one that demands profound creativity, argues Giovanni Vignale.

Explaining them is curiously akin to the craft of poets, or magical realist novelists such as Borges, and Musil, or Bulgakov's *The Master and Margarita*. In this unusual and sometimes poetic book, Vignale presents his own unorthodox accounts of fundamental theoretical concepts such as Newtonian mechanics, superconductivity, and Einstein's theory of relativity, showing that what may seem at first quite simple in fact turns out to be much more profound. A computer program for analyzing axisymmetric shells with inertial forces caused by rotation about the shell axis is developed by revising the STARS II shell program. The basic capabilities of the STARS II shell program, such as the treatment of the branched shells, stiffened wall construction, and thermal gradients, are retained.

This book contains lectures delivered at the 10th Physics Summer School on "Physics of Novel Materials" at Australian National University by internationally reputed scientists. It covers a wide variety of materials: semiconductors, superconductors, polymers, zeolites, clusters and nanostructures, and transport in novel materials. The frontiers of beam research point to increasingly high energy, greater brightness and lower emittance beams with ever-increasing particle species. These demands in turn have triggered a rapidly growing number of beam phenomena that involve quantum effects. Concurrently, the violent accelerations which are becoming available through novel accelerator research may, perhaps, help to investigate fundamental physics associated with general relativity. In view of these exciting developments and the important role they may play in the next century, the world's first conference on the "Quantum Aspects of Beam Physics", held at
