Mycotoxins are poisonous chemical compounds produced by certain fungi. There are many such compounds, but only a few of them are

regularly found in food and animal feedstuffs.

Nevertheless, those that do occur in food and feed have great significance in the health of humans and livestock. The effects of some mycotoxins are acute, with symptoms of severe illness appearing very quickly. Other mycotoxins have

longer term chronic or cumulative effects on health, including the induction of cancers and immune deficiency.

Information about mycotoxins is far from complete, but enough is known to identify them as a serious problem in many parts of the world, causing significant economic

losses in addition to their negative health effects. 'The mycotoxin factbook' is aimed at the latest developments to combat the mycotoxin problem. The book contains the peer-reviewed papers of the third conference of the World Mycotoxin Forum. The various chapters focus on

mycotoxin food and feed risks in the context of human nutrition and animal feeding. Topics dealt with in 'The mycotoxin factbook' are: -

- The latest information on major mycotoxins and emerging**
