

Catalogue Of British Coleoptera

This publication provides a comprehensive review of the nomenclature and distribution of the Geadephaga of America, north of Mexico. Overall 2439 valid species-group taxa in 208 genera are catalogued along with their synonyms. Besides the usual information pertaining to author(s), date and page of publication, the type locality, location of name-bearing type, first reference establishing each synonym, and etymology for many patronymic names are provided for species-group names. Genus-group names are listed with the author(s), year of publication, page citation, type species with manner of fixation and etymology for most. The geographical distributions of all species-group taxa are briefly summarized and their state and province records are indicated. About 2500 references are listed with publication dates for many in order to assess priority of names.Several new nomenclatural acts are introduced including one new genus-group taxon, one new replacement name, three changes in precedence, five new genus-group synonymies, 65 new species-group synonymies, one new species-group status, and 12 new combinations.The work includes also a discussion of the notable private North American carabid collections, a synopsis of all extant world geadephagan tribes and subfamilies, a brief faunistic assessment of the fauna, a list of North American fossil Geadephaga, a list of North American Geadephaga larvae described or illustrated, a list of species described from specimens mislabeled as from North America, and a list of unavailable names listed from North America.

Subject Index of the Modern Works Added to the British Museum Library

This is the sixth volume of a comprehensive series which covers about 100,000 species of Coleoptera known to occur in the Palaearctic Region. The information provided for each species is as follows: primary taxonomic information of all available names in the genus and species levels published by the end of 1999; the taxonomic information below subfamily, organized alphabetically; and the type species of genera and subgenera, including synonyms. Distributional data of species and subspecies is given per country. Detailed distributional information for strict endemics is provided, and introduced species are indicated. The series is a collective work of about one hundred coleopterists from Europe, Japan, America, and Australia.

Excerpt from Catalogue of the Coleopterous Insects of Madeira: In the Collection of the British Museum Although strictly an enumeration of the Madeiran Coleoptera contained in the British Museum, the present Catalogue has the advantage of being also a general one; for, through the liberality of the only three gentlemen (Messrs. Bewicke, Mason, and Ross) who happened to possess what I could not myself place there, I am glad to have it in my power to state, that every species which has been hitherto detected in those islands is now represented in the National Collection. Exactly 100 species (63 of which I have regarded as new to science) have been brought to light, in the Madeiras, since the publication of the Insecta Maderensia, in 1854; three moreover (Trechus l vis, Ellipsodes oblongior, and Stenus fulvescens) have been added, which I had looked upon, up to that date, as mere modifications of others; whilst five forms, which, from insufficient evidence, I had described as species (viz. Tarphius spinipes, Ptinus longicornis, Atlantis lauripotens and austrinus, and Stagonomorpha unicolor), have been treated as varieties: so that the total number is now augmented (from 482) to 580. As would of course be anticipated, these 580 species are composed of insects which are partly indigenous and partly introduced; and it is only by a careful observation of them in situ, and a close inquiry into their various habits, that it can be decided to which of these two classes the several creatures belong.
