*This text deals with the dredging of rock by large cutter suction dredgers. The rock properties influencing the mechanical cutting of rock and the wear of cutting teeth are examined, and to verify the model of mechanical rock excavation developed, case studies of dredging projects were performed.*

*I am pleased to present a work which marks a milestone in the history of public works and, more precisely, in that of permanent structures—a comprehensive dictionary of Civil Engineering terms. Since the beginning of time, Man has always tried to find a means to clear the obstacles which nature erected to displace him. With the first tree trunk thrown across a river, man sought to improve the crossing structure. After the invention of the wheel, and to satisfy his thirst for conquest (Roman ways), and comfort (aqueducts), man built bridges that became a preremportory necessity to move quickly. Thus, Man started to build wooden and masonry works. With the passing centuries, the builders became masters in the art of building masonry works. Then came the Industrial Revolution and the advent of the steel (1864), which was closely followed by the invention of the reinforced concrete (1855). The need for railways and improving the road network inspired great works of crossing such as viaducts and tunnels. The boom of the railway network and the development of the car required the construction of an increasing number of new structures. This phenomenon continues today with hundreds of structures built each year throughout the world.*

***This unusual account is written by the 27th Earl of Crawford and Balcarres, an active Lancashire MP for 18 years until he inherited the title on his father's death in 1913. In 1915 his sense of patriotic duty drove him to join the RAMC as a Private, although he was married with 7 children, head of a large company and well over age. Despite his privileged status in civilian life, he cheerfully served as a humble medical orderly on the Western Front for some 14 months and was given responsibility for two operating theatres. A gifted author and diarist, his daily entries provide a fascinating insight into life near the front over this period and, together with his letters home, his writings reflect the stark contrast between his home life and the one he experienced in Flanders. Of particular interest are his astute observations on his contemporaries of all ranks, the conduct of the war, medical services and life in wartime France. Remarkably he never complains at his lot (although often sharply critical of GHQ and politicians) or regrets his decision. As the Author was the only Cabinet-level politician to serve 'in the ranks' during the conflict, this is a record without any parallel. In 1916 Crawford was persuaded eventually to return to London and join Asquith's Cabinet before staying on under Lloyd George until 1922. After the war, he became a director, trustee or advisor of several museums, such as the British Museum, National Gallery and others. The Crawford Papers (his diaries, edited by Prof John Vincent) describe his civilian experiences from 1892 to 1940 and are seen as an invaluable source for students of politics, art, industry and society in Britain. The book contains three maps and 75 illustrations. This fascinating book fills a needy gap at a time of unprecedented interest in The Great War. Frontiers in Offshore Geotechnics III comprises the contributions presented at the Third International Symposium on Frontiers in Offshore Geotechnics (ISFOG, Oslo, Norway, 10-12 June 2015), organised by the Norwegian Geotechnical Institute (NGI). The papers address current and emerging geotechnical engineering challenges facing those working in off

Ground improvement has been one of the most dynamic and rapidly evolving areas of geotechnical engineering and construction over the past 40 years. The need to develop sites with marginal soils has made ground improvement an increasingly important core component of geotechnical engineering curricula. Fundamentals of Ground Improvement Engineering addresses the most effective and latest

cutting-edge techniques for ground improvement. Key ground improvement methods are introduced that provide readers with a thorough understanding of the theory, design principles, and construction approaches that underpin each method. Major topics are compaction, permeation grouting, vibratory methods, soil mixing, stabilization and solidification, cutoff walls, dewatering, consolidation, geosynthetics, jet grouting, ground freezing, compaction grouting, and earth retention. The book is ideal for undergraduate and graduate-level university students, as well as practitioners seeking fundamental background in these techniques. The numerous problems, with worked examples, photographs, schematics, charts and graphs make it an excellent reference and teaching tool.

Training Levels: Awareness, Operations, Technician

This text provides an insight into the wear processes which take place during the cutting of rock with steel cutting tools. Rock cutting experiments in different rock types leading to a new approach to the estimation of rock cutting tool wear are described.

Trench Rescue: Awareness, Operations, Technician, Second Edition is the most comprehensive, up-to-date trench rescue textbook on the market. This new, full color edition will help fire and rescue personnel learn the procedures necessary to conduct rescue operations that will mitigate most types of trench collapse incidents. Based on NFPA 1006, Standard for Rescue Technician Professional Qualifications, 2003 Edition, the text is designed for awareness, operations, and technician level trench rescue courses.

Turn to Trench Rescue: Awareness, Operations, Technician, Second Edition for updated coverage of trench tools and equipment, PPE, rescue system preparation, types of collapses, hazard control, and more!
