Although a number of comprehensive texts pertaining to perioperative medicine are available, this remains the only one that focuses specifically on the patient undergoing orthopedic surgery, now in a revised and expanded second edition. Beginning with chapters covering preoperative evaluations and general principles and practices of perioperative medicine, the book then considers anesthesiologic management in orthopedic surgery and the role of postoperative pain management. This is followed by section on medical management in specific clinical settings discussing patients with connective tissue disease, cardiac disease, chronic pulmonary and renal diseases, diabetes and neurological diseases, among others. A fourth section covers specific perioperative problems in orthopedic surgery, such as care of the elderly patient, venous thromboembolism, infection, nutrition, compartment syndrome and bone health. Finally, the role of allied services, quality improvement and ethics are highlighted. Selected case studies are included to illustrate real-world perioperative issues and management strategies in orthopedic surgery, now moved to their respective chapters for ease of use and reference. The shared key points and chapter objectives boxes at the beginning of each chapter, and the summary points at the end of each chapter, have been retained and updated within a full-color interior. Written by experts at the top-ranked Hospital for Special Surgery in New York, *Perioperative Care of the Orthopedic Patient, 2e* will be a comprehensive,

This book reviews the main topics in thromboprophylaxis around orthopedic surgery, from a general scope of the problems with the disease highlighting them in orthopedics to the new specific protocols involving, for example, new oral anticoagulants. The prevalence of the venous thromboembolism in each procedure (from "easy" to "hard" surgeries, with different rates of related thrombosis) and the risk factors to bear in mind in each one (related and non-related with the orthopedic procedure) are also revised. A chapter focus on the diagnosis and treatment of venous thromboembolism, which is commonly "forgotten" in many books addressed to orthopedic surgeons and

anaesthesiologists. The methods for thromboprophylaxis have three specific chapters: the most common drugs used and recommended when pharmacological prophylaxis is needed, new drugs which are arising day by day and which management will be of main importance in a close near future, and mechanical methods, recommended both as additional when possible and for sole indications when the risk of bleeding could move us to minimize the real risk of thrombosis. Anaesthetic implications for thromboprophylaxis and, also, main implications of the application of antithrombotic protocols in the anaesthetic practice are covered by another chapter. In our opinion it was very important to divide the orthopedic procedures according to their own thrombotic risk, so having their own protocols for thromboprophylaxis: high risk, day surgery procedures and "special" surgical procedures are included in three different chapters, from three different authors with complementary views. Finally, in a last chapter, we review the problems involving the perioperative management of antiaggregated and anticoagulated patients, with a special part in hip fracture surgery.
