Consciousness As A State Of  
Matter Arxiv

# Consciousness As A State Of Matter Arxiv

*In Basic Structures of Reality, Colin McGinn deals with questions of metaphysics, epistemology, and philosophy of mind from the vantage point of physics. Combining general philosophy with physics, he covers such topics as the definition of matter, the nature of space, motion, gravity, electromagnetic fields, the character of physical knowledge, and consciousness and meaning. Throughout, McGinn maintains an historical*

***perspective and seeks to determine how much we really know of the world described by physics. He defends a version of "structuralism": the thesis that our knowledge is partial and merely abstract, leaving a large epistemological gap at the center of physics. McGinn then connects this element of mystery to parallel mysteries in relation to the mind. Consciousness emerges as just one more mystery of physics. A theory of matter and space is developed, according to which the impenetrability of matter is explained as the deletion of volumes of space. McGinn proposes a philosophy of***

***science that distinguishes physics from both psychology and biology, explores the ontology of energy, and considers the relevance of physics to seemingly remote fields such as the theory of meaning. In the form of a series of aphorisms, the author presents a metaphysical system that takes laws of nature as fundamental. With its broad scope and deep study of the fundamental questions at the heart of philosophy of physics, this book is not intended primarily for specialists, but for the general philosophical reader interested in how physics and philosophy intersect.***

***This international selection of 34 papers from the Tokyo '99 conference held at the United Nations University gives a valuable state of the art overview of consciousness research. Not only the recognized European and American approaches but also the distinguishing approaches from many Japanese researchers are presented. It will provide a world-wide audience with a comprehensive outlook for the remarkable potential contribution in the future scene of consciousness research. The Tokyo '99 declaration to promote scientists' ethical warning against the thoughtless aiming of consciousness research at***

**warfare is also included.(Series B)**

**Consciousness is one of the most significant scientific problems today. Renewed interest in the nature of consciousness - a phenomenon long considered not to be scientifically explorable, as well as increasingly widespread availability of multimodal functional brain imaging techniques (EEG, ERP, MEG, fMRI and PET), now offer the possibility of detailed, integrated exploration of the neural, behavioral, and computational correlates of consciousness. The present volume aims to confront the latest theoretical insights in**

***the scientific study of human consciousness with the most recent behavioral, neuroimaging, electrophysiological, pharmacological and neuropathological data on brain function in altered states of consciousness such as: brain death, coma, vegetative state, minimally conscious state, locked-in syndrome, dementia, epilepsy, schizophrenia, hysteria, general anesthesia, sleep, hypnosis, and hallucinations. The interest of this is threefold. First, patients with altered states of consciousness continue to represent a major clinical problem in terms of clinical***

***assessment of consciousness and daily management. Second, the exploration of brain function in altered states of consciousness represents a unique lesional approach to the scientific study of consciousness and adds to the worldwide effort to identify the "neural correlate of consciousness". Third, new scientific insights in this field have major ethical and social implications regarding our care for these patients. Consciousness is difficult to pin down. Most human beings go about their days with full and more or less uninterrupted consciousness, without***

***contemplating their own (or other peoples') conscious states. To be in the world, and accomplish great acts takes little metaawareness of consciousness, but in the study of consciousness our inability to think outside of our conscious states creates controversies at the conceptual and methodological levels. As Victor Lamme states (2006), even when we set aside the more difficult (or more poorly defined) questions about conscious experience to focus on finding the neural correlates of consciousness (NCC), we face immense difficulties (Lamme, 2006, p. 494). Experiments designed to find the***

***NCC often involve the manipulation of conscious states through anesthesia, the study of sleep, or brain lesion studies (Lamme, 2006, p. 494). However, even in the case of anesthesia, where we can voluntarily induce a reversible altered state of consciousness there does not seem to be a clear dividing line between consciousness and unconsciousness with any of the processed electroencephalogram (EEG) signals (Guzeldere, 1998, p. 1) such that the conscious and unconscious states are still confirmed behaviorally (Lamme, 2006, p. 494). This leads to a problem, as it must be decided***

***what "behavioral measures 'count' as evidence for the subject having conscious experience (p. 494)" a problem that is not so simple as the ability to speak and respond, as will be more clear in a later discussion of intraoperative awareness. Furthermore, Guven Guzeldere points to the difficulty of defining what "the problem of consciousness" is, within and "across disciplinary boundaries (Guzeldere, p. 7)." The problems that philosophers of consciousness, cognitive scientists and neuroscientists address when they study consciousness are not inevitably going to be identical, but are***

***shaped by disciplinary perspectives, methods and technologies. Therefore, in this paper I am going to contrast two similar models of consciousness, Giulio Tononi's Integrated Information Theory and Daniel Dennett's Multiple Drafts Model, and evaluate them against the mechanisms of several anesthetics (Propofol, ketamine, and the inhalation anesthetics, including xenon), which will be summarized by a review of the literature. I have two goals in mind with this project: first, I have chosen two very similar models in order to demonstrate how small differences- such as Tononi's***

***engagement with the concept of qualia and Dennett's deconstruction of it-- have large implications for what types of knowledge are possible when these models are applied; second, I am summarizing the literature concerning the study of anesthetics to show both that anesthetics are useful for the elucidation of the neural correlates of consciousness, and that there is a danger of conflating the neural correlates of unconsciousness with a full description of how consciousness arises, or what consciousness is. Moreover, I will argue that because Dennett's model specifically addresses the***

## Consciousness As A State Of Matter Arxiv

transpersonal experiences that involve an expansion of consciousness beyond the limits of time and space. Altered states of consciousness allow us to answer the questions of who we really are and why we are here. Topics included in this book are: Spirituality, Intuitions, Channeling, Neurotechnology and Holotropic therapy.

States of Consciousness, a classic by world authority Charles T. Tart, is a basic understanding of how the mind is a dynamic, culturally biased, semi-arbitrary construction and system. A systematic exploration of how and why altered states can come about and their possibilities. As a student of his remarked, "For the first weeks of class I didn't understand what those

diagrams were about, but I've realized the book is all about the way my own mind works! Useful in understanding some of the important ways your mind works before you start altering it.

The second edition of *The Neurology of Consciousness* is a comprehensive update of this ground-breaking work on human consciousness, the first book in this area to summarize the neuroanatomical and functional underpinnings of consciousness by emphasizing a lesional approach offered by the study of neurological patients. Since the publication of the first edition in 2009, new methodologies have made consciousness much more accessible scientifically, and, in particular, the study of disorders, disruptions, and

disturbances of consciousness has added tremendously to our understanding of the biological basis of human consciousness. The publication of a new edition is both critical and timely for continued understanding of the field of consciousness. In this critical and timely update, revised and new contributions by internationally renowned researchers—edited by the leaders in the field of consciousness research—provide a unique and comprehensive focus on human consciousness. The new edition of *The Neurobiology of Consciousness* will continue to be an indispensable resource for researchers and students working on the cognitive neuroscience of consciousness and related disorders, as well as for neuroscientists,

psychologists, psychiatrists, and neurologists contemplating consciousness as one of the philosophical, ethical, sociological, political, and religious questions of our time. New chapters on the neuroanatomical basis of consciousness and short-term memory, and expanded coverage of comas and neuroethics, including the ethics of brain death The first comprehensive, authoritative collection to describe disorders of consciousness and how they are used to study and understand the neural correlates of conscious perception in humans. Includes both revised and new chapters from the top international researchers in the field, including Christof Koch, Marcus Raichle, Nicholas Schiff, Joseph Fins, and

Michael Gazzaniga

How can the fine-grained phenomenology of conscious experience arise from neural processes in the brain? How does a set of action potentials (nerve impulses) become like the feeling of pain in one's experience? Contemporary neuroscience is teaching us that our mental states correlate with neural processes in the brain. However, although we know that experience arises from a physical basis, we don't have a good explanation of why and how it so arises. The problem of how physical processes give rise to experience is called the 'hard problem' of consciousness and it is the contemporary manifestation of the mind-body problem. This book

Chalmers, and Israel Rosenfield. He challenges claims that the mind works like a computer, and that brain functions can be reproduced by computer programs. With a sharp eye for confusion and contradiction, he points out which avenues of current research are most likely to come up with a biological examination of how conscious states are caused by the brain. Only when we understand how the brain works will we solve the mystery of consciousness, and only then will we begin to understand issues ranging from artificial intelligence to our very nature as human

This volume presents a selection of invited papers from the third conference. It showcases recent progress in this maturing field by researchers from philosophy, neuroscience, cognitive psychology, phenomenology, and physics. It is divided into nine sections: the explanatory gap, color, neural correlates of consciousness, vision, emotion, the evolution and function of consciousness, physical reality, the timing of conscious experience, and phenomenology. Each section is preceded by an overview and commentary by the editors. Contributors Dick J. Bierman, Jeffrey

Consciousness and the World**

Brings together some of the most important research publications on the philosophical problem of consciousness. It includes a detailed introduction that surveys the leading issues in the current debate.

Despite the increase in meditation studies, the quality remains variable; many of them are trivial, and most remain unreplicated. Research on meditation has been plagued by

insubstantial theorizing, global claims, and the substitution of belief systems for grounded hypotheses. Meditation punctures some of the myths about meditation, while retaining a place of value for mediation as a normal human function. In each chapter includes discussion of the major questions addressed, followed by a detailed critique of important theoretical, clinical, and research issues. In several instances the reader may find that questions seem to beget questions: research bearing upon certain issues may be contradictory, or not yet of sufficient thoroughness. In these cases, the author suggests the specific future research necessary to resolve the questions

posed, so that claims about meditation are justified, and which are not. The profession of psychology itself is, and has been, in a polarized debate between the "practitioners" and the "experimentalists." The latter accuse the former of being "soft, non-empirical, non-scientific," while practitioners accuse the experimentalists of conducting research which is essentially irrelevant to human concerns. This approach provides a bridge between research and clinical practice. Meditation provides an encompassing survey of the topic--nearly forty tables and figures; sample questionnaires, evaluations and programs and a detailed

Brian O'Shaughnessy puts forward a bold and original theory of consciousness, one of the most fascinating but puzzling aspects of human existence. Whatever mystery there may be about the origins of consciousness, O'Shaughnessy suggests that there is no mystery about what it is. He proceeds to give a philosophical elucidation of its

Download File PDF

## Consciousness As A State Of Matter Arxiv

nature, analysing it into purely psychological constituents. It is his contention that consciousness consists in a closely knit complex of occurrent mental phenomena and powers with thinking and self-knowledge at the centre--and nothing else. O'Shaughnessy's analysis accords a position of pre-eminence to the epistemological properties of consciousness. With this in mind he investigates the closely linked concepts of attention and perception alongside that of consciousness. He sets out an integrated theory of these three fundamental phenomena, demonstrating how close to the heart of consciousness is perception, envisaged already in the very

Download File PDF

## Consciousness As A State Of Matter Arxiv

concept. In effect he advances en passant a variant of empiricism which is based upon the nature of consciousness. A considerable part of the book is devoted to providing a theoretical account in these terms of those important senses through which the mind constitutes physical objects in space: above all, the highly developed sense of sight, but also the primordial body-senses, proprioception and touch, which underpin all else in the mind. In such ways concrete interaction between consciousness and the world is realized, and the epistemological basis of mind established.

Consciousness and the World is a rich and exciting book, a major contribution to our understanding of

## Consciousness As A State Of Matter Arxiv

treatment and study of disorders of consciousness; controversies about end-of-life care for those with advanced dementia; and arguments about the moral status of embryos, fetuses, and non-human animals arguably turn on the moral significance of various facts about consciousness. However, though work has been done on the moral significance of elements of consciousness, such as pain and pleasure, little explicit attention has been devoted to the ethical significance of consciousness. In this book Joshua Shepherd presents a systematic account of the value present within conscious experience. This account emphasizes not only the nature of consciousness, but also the importance of items within experience such as affect, valence, and the complex overall shape of particular

valuable experiences. Shepherd also relates this account to difficult cases involving non-humans and humans with disorders of consciousness, arguing that the value of consciousness influences and partially explains the degree of moral status a being possesses, without fully determining it. The upshot is a deeper understanding of both the moral importance of phenomenal consciousness and its relations to moral status. This book will be of great interest to philosophers and students of ethics, bioethics, philosophy of psychology, philosophy of mind, and cognitive science.

Within the field of neuroscience, the past few decades have witnessed an exponential growth of research into the brain mechanisms underlying both normal and pathological states of

experiences have long been ignored by mainstream science, or considered crazy fantasies. Recent research, however, has located the neural underpinnings of these altered states of mind. In this book, neuropsychologist Marc Wittmann shows how experiences that disturb or widen our everyday understanding of the self can help solve the mystery of consciousness. Wittmann explains that the relationship between consciousness of time and consciousness of self is close; in extreme circumstances, the experiences of space and self intensify and weaken together. He considers the emergence of the self in waking life and dreams; how our sense of time is distorted by extreme situations ranging from terror to mystical enlightenment; the experience of the

moment; and the loss of time and self in such disorders as depression, schizophrenia, and epilepsy.

Dostoyevsky reported godly bliss during epileptic seizures; neurologists are now investigating the phenomenon of the epileptic aura. Wittmann describes new studies of psychedelics that show how the brain builds consciousness of self and time, and discusses pilot programs that use hallucinogens to treat severe depression, anxiety, and addiction. If we want to understand our consciousness, our subjectivity, Wittmann argues, we must not be afraid to break new ground. Studying altered states of consciousness leads us directly to the heart of the matter: time and self, the foundations of consciousness.

Altered States of Consciousness

Transpersonal psychology is the study of human nature and development that assumes that human beings possess potentials that exceed the limits of ego developed normally. The main goal of transpersonal psychology is to integrate the spiritual experience within a broader understanding of the human psyche and consciousness.

Biofeedback and Neurotechnology introduces the use of biofeedback and neurotechnology for the transpersonal therapist to induce and measure altered states of consciousness to deal with persons having mental conditions. The therapist and the patient can benefit from self-exploration and self-realization of altered consciousness that could be responsible for the mental condition of the patient. Chapters in the book start with an introduction to the theory of consciousness and transpersonal psychology followed by an explanation of the relationship of quantum physics to consciousness model. The book then progresses towards in depth

topics such as biofeedback which covers the measurement parameters for understanding consciousness and computer-based technologies that help induce altered states of consciousness. Finally, the book concludes by linking all the concepts together to guide the transpersonal psychologist to measure and support transpersonal psychotherapy through a cybertherapy system. Transpersonal Psychology: Altered States of Consciousness, Biofeedback and Neurotechnology is an ideal guide for the transpersonal psychologist and psychotherapist and the enthusiast who wants to understand the science behind altered states of consciousness

from a theoretical and experimental framework.

Breakthroughs in Understanding the Biology of Consciousness This textbook covers fundamental discoveries about the biological basis for spiritual and shamanic states, transpersonal experiences, and consciousness itself. Derived from explorations into the very earliest prenatal development, this book describes how consciousness is based on biology inside the cell.

Developmental Events: Spiritual and shamanic states are a legacy of our earliest prenatal growth stages. The Primary Cell:

Consciousness extends from just one cell of the body. Triune

Brains: The cell organelles are the basis of the 'subconscious' triune

brains. Transpersonal Biology: Spiritual, shamanic, and psychic phenomena are based on access or perception of biological structures inside the cell. Inherent Dangers: Triggering certain prenatal traumas may cause serious or life-threatening problems. With this theoretical foundation, we can now understand what traditional spiritual and shamanic practices do at a biological level, as well as understand what makes different healing therapies effective. More important are the very practical applications - entirely new techniques for spiritual growth and healing become possible, through a synthesis of traditional concepts with modern microbiology. subjectivity in philosophy of mind and the idea that phenomenal consciousness could not be reduced to functional or cognitive properties, this volume includes twenty-two unique contributions from leading scholars in the field. Asking questions such as: Why we should think that self-consciousness is non-reflective? Is subjectivity first-personal? Does consciousness necessitate self-awareness? Do we need pre-reflective self-consciousness? Are ego-disorders in psychosis a dysfunction of pre-reflective self-awareness? How does the Cartesian duality between body and mind fit into Sartre's conceptions of consciousness? Consciousness, 'the last great mystery for science', remains a

hot topic. How can a physical brain create our experience of the world? What creates our identity? Do we really have free will? Could consciousness itself be an illusion? Exciting new developments in brain science are continuing the debates on these issues, and the field has now expanded to include biologists, neuroscientists, psychologists, and philosophers. This controversial book clarifies the potentially confusing arguments, and the major theories, whilst also outlining the amazing pace of discoveries in neuroscience. Covering areas such as the construction of self in the brain, mechanisms of attention, the neural correlates of consciousness, and the

***What goes on in our head when we have a thought? Why do the physical events that occur inside a fistful of gelatinous tissue give rise to the world of conscious experience? In *The Universe of Consciousness*, Gerald Edelman and Giulio Tononi present for the first time a full-scale theory of consciousness based on direct observation of the human brain in action. Their pioneering work, presented here in an elegant style, challenges much of the conventional wisdom about consciousness. *The Universe of Consciousness* has***

***enormous implications for our understanding of language, thought, emotion, and mental illness.***

***In this dissertation, I examine the nature and structure of consciousness. Conscious experience is often said to be phenomenally unified, and subjects of consciousness are often self-conscious. I ask whether these features necessarily accompany conscious experience. Is it necessarily the case, for instance, that all of a conscious subject's experiences at a time are phenomenally unified? And is***

***it necessarily the case that subjects of consciousness are self-conscious whenever they are conscious? I argue that the answer to the former is affirmative and the latter negative. In the first chapter, I set the stage by distinguishing phenomenal unity from other species of conscious unity. A pair of conscious states is phenomenally unified if they are experienced together as part of a single experience that encompasses them both. In this and the next two chapters I defend the thesis that, necessarily, for any subject (of conscious mental states) at***

***any time, all of that subject's conscious mental states (at that time) are part of a single, maximal state of consciousness. I call this thesis the "Unity Thesis." I proceed by considering some preliminary questions that might be raised about the Unity Thesis. For instance, the thesis presupposes that it is coherent to talk about parts of mental states. I consider objections by Tye and Searle and argue that the notion of an experiential part is unproblematic. In the remaining pages of the chapter, I present the source***

***of the biggest challenge to the Unity Thesis: the data gathered from split-brain subjects. The Unity Thesis is formulated using the notion of a maximal state of consciousness. In the second chapter, I attempt to precisify this notion in a way that does not pre-emptively decide the debate over the Unity Thesis. In informal terms, a maximal state of consciousness is a sum of conscious states that are i) simultaneous, ii) have the same subject, and iii) all have a conjoint phenomenology. I call this the Consensus View. I then***

***consider two unorthodox views that the Consensus View does not take off the table: the views that a "collective consciousness" and a "spread consciousness" are possible. A collective subject is one that can enjoy the experiences of an indeterminate number of "lesser" subjects of consciousness by sharing them together with those subjects. A spread subject is one that can enjoy the experiences of an indeterminate number of lesser subjects of consciousness, but it does so,***

***not by sharing those experiences with the lesser subjects, but by absorbing the lesser subjects of experience into itself, thereby erasing the traditional boundaries between the entities we intuitively think of as subjects of experience. I argue that, although the Consensus View does not decide against them, these views stretch the bounds of coherence and should not, therefore, be accepted. Having presented an account of what maximal state of consciousness is, I define a stream of consciousness in terms of a maximal states of***

***consciousness. In the rest of chapter two, I consider and argue against a number of different ways of interpreting the split-brain data that are either inconsistent with the Unity Thesis or attribute more than one subject of consciousness to split-brain subjects. Among the views I consider are Lockwood's partial-unity view and the views, by theorists such as Sperry, Koch, Puccetti, Marks, and Tye, that split-brain subjects have two non-overlapping streams of consciousness. In chapter three, I consider a recent***

***attempt by Bayne to account for the split-brain data in a way that does not attribute two streams of consciousness to them. According to Bayne's Switch Model, the consciousness of split-brain subjects can be likened to that of a ball that is passed back and forth between the two hemispheres of the upper-brain. The hemispheres take turns supporting a single stream of consciousness. I consider the empirical data in some detail and argue that the data is not as compatible with the Switch Model as Bayne claims. I close the chapter by***

***presenting the rough outline of an interpretation of the split-brain data that is consistent with both the Unity Thesis and the split-brain data. In chapter four, I turn from defending the Unity Thesis to examining an attempt to account for conscious unity. Rosenthal has offered a theory of conscious unity as an extension of his higher-order theory of consciousness. I consider his account of conscious unity in light of a well-known objection to his theory: the (Representational) Mismatch Objection. It can be asked what it is like for a***

***subject of experience when a higher-order state misrepresents its target first-order state. If what it is like for the subject corresponds to the content of the higher-order state, then it appears as though higher-order representation is unnecessary for conscious experience, for it would appear as though it is possible for a state to be conscious without being represented by a higher-order state. If what it is like corresponds to the content of the lower-order state, then it would again seem as though representation at the higher-***

***order level is unnecessary for conscious experience, for the higher-order state would not seem to be doing any work in generating the experience. I consider and argue against two recent defences of Rosenthal's higher-order theory from the Mismatch Objection. Then I turn to Rosenthal's account of conscious unity. Rosenthal's account posits two mental mechanisms. I refer to the ways of accounting for conscious unity via these two mechanisms as the "gathering strategy" and the "common-ascription strategy"***

***respectively. Both of these strategies, I argue, appear to locate the basis for certain phenomenal facts in higher-order representational facts. This raises a prima facie question: does Rosenthal's account of conscious unity land him square within the sights of the Mismatch Objection? Although the gathering strategy may ultimately be understood in a way that does not make it subject to the Mismatch Objection, Rosenthal has certain commitments that bar this strategy from serving as a complete account of***

***conscious unity. This is problematic for Rosenthal, I argue, because his common-ascription strategy faces some difficult questions. This strategy makes conscious unity due to an implicit expectation a subject of consciousness has that, whenever he or she engages in introspection, an explicit sense of conscious unity will be generated. I argue that it is very difficult to see how such an implicit sense could both avoid the Mismatch Objection and do the work it needs to do in order to account for conscious unity. In chapter***

***five, the discussion turns from the unity of consciousness to self-consciousness. The question that is considered in this and the last chapter is the question whether conscious experience is necessarily accompanied by self-consciousness. The affirmative answer to this question I call the Ubiquity Thesis. I spend some time distinguishing robust conceptions of self-consciousness from minimal conceptions of self-consciousness. The notion of self-consciousness invoked by the Ubiquity Thesis is a***

***minimal one. In spite of the fact that the Ubiquity Thesis invokes only a minimal or thin conception of self-consciousness, I believe the thesis to be false and argue against it. In this chapter I take up the views of Husserl. Husserl is often regarded as the progenitor of the phenomenological tradition, a tradition in which many philosophers affirm the Ubiquity Thesis. I examine and argue against an interpretation of Husserl's work, one defended by Zahavi, according to which Husserl could be seen to defend the Ubiquity***

***Thesis. One claim that Husserl makes is that, in order for an object to become the intentional target of a conscious state, it must be given to consciousness beforehand. It is possible, during acts of deliberate introspection, for consciousness to take itself as its object. On Husserl's view, this requires consciousness to be given to itself beforehand. This self-givenness of consciousness, argues Zahavi, can be seen as a kind of minimal self-consciousness. Husserl has also offered an account of this***

***self-givenness of consciousness and it appears in his discussion of inner time-consciousness. I attempt to argue, using some of Husserl's other views regarding psychological stances (or standpoints), that consciousness is not given to itself outside of the adoption of a certain psychological standpoint. I also offer an alternative way of accounting for inner time-consciousness, one that does not have, as a built-in feature, that consciousness always has itself as a secondary object. In the sixth and final chapter, I***

***take up a contemporary defence of the Ubiquity Thesis. Kriegel, a higher-order theorist like Rosenthal, has argued that every conscious state is conscious in virtue of the fact that it represents itself. This self-representation is understood as a kind of self-consciousness and, thus, his theory can be seen as affirming the Ubiquity Thesis. In the first part of the chapter, I take issue with the way in which Kriegel lays out the conceptual terrain. In particular, Kriegel countenances a property he calls "intransitive state self-***

***consciousness." I argue that this way of speaking is confused. I then turn to considering Kriegel's account. Kriegel identifies the species of self-consciousness that pervades all of conscious experience with a peripheral awareness of one's own mental states. I argue that such a peripheral inner awareness does not accompany all of our mental states and, thus, that Kriegel's views do not give us reason to accept the Ubiquity Thesis.***
