The use of computation and simulation has become an essential part of the scientific process. Being able to transform a theory into an algorithm requires significant theoretical insight, detailed physical and mathematical understanding, and a working level of competency in programming. This upper-division text provides an unusually broad survey of the topics of modern computational physics from a multidisciplinary, computational science point of view. Its philosophy is rooted in leading-edge cutting-edge programs including: Monte Carlo simulation, and molecular dynamics simulation for physics, quantum mechanics and large scale projects. It is probably the easiest text for students to learn from for beginners, yet it is also useful for more advanced students and has packages for excellent graphics and even symbolic manipulators. The text is designed for an upper-level undergraduate or beginning graduate course and provides the reader with the essential knowledge to understand computational tools and mathematical methods well enough to be successful. As part of the teaching of using computers to solve scientific problems, the reader is encouraged to work through a sample problem stated at the beginning of each chapter or unit, which involves studying the text, writing, debugging and running programs, visualizing the results, and the expressing in words what has been done and what can be concluded. There are exercises and problems at the end of each chapter for the reader to work on their own (with model programs given for that purpose).

Over the years we have heard many complaints that there is no verysimple book on cardiac pacing for real beginners. We have alsoheard that all the books on cardiac pacing are too complicated andimpossible to understand by beginners. Many have voiced the hopehat one day someone would write a book in the same style asDubin's book on basic electrocardiography which is a hugebestseller with well over a million sold in many languages. A'Dummy' book on cardiac pacing would appeal to nurses,cardiology technicians, medical students and pacemaker companieesfor training their staff. We started with the assumption that the reader would know theprinciples of electrocardiography as in Dubin's book butnothing about cardiac pacing. We carefully studied the Dubin bookand believe that we have improved his teaching method. The bookconsists of numbered illustrations each illustrating a concept inchef form of a diagram drawn professionally. We have been careful tomake the artwork simple for easy comprehension. Each illustration will occupy a page and have several lines oftext below it. We have already completed most of these. It isessential that there are all in color, this is a unique sellingpoint. The 3 authors have had vast experience in the field. Dr Baroldhas for over 10 years been cardiac pacing and wrote the section oncardiac pacing in the 4th and 5th Edition of Braunwald'sbook, Heart Disease. S. George Barold, Roland Strohbandt and Alfons Sinaave Content: The plates depicting a concept with occupy 1 pages. Each plateconsists of a diagram and a short text. All diagrams are in color.
