Traditional tactical communications systems consist of a number of separate subsystems with little interworking between them and with external sensors and weapons systems. Combat net radio (CNR) has provided the high-mobility communications required by combat troops, while trunk communications systems have provided high-capacity communications between headquarters at the expense of mobility. The focus of this book is on new, information-age technologies that promise to offer seamless integration of real-time data sharing, creating

a single logical network architecture to facilitate the movement of data throughout the battlespace. Because the structure of this network is constrained by the fundamental trade-off between range, mobility and capacity that applies to all communications systems, this network is unlikely to be based on a single network technology. This book presents an architecture for this network, and shows how its subsystems can be integrated to form a single logical network.

Schedule quantitative risk analysis (SQRA) is a process of calculating the overall probability or chance of completing a project on time and budget.

Quantification uses various approaches and methods. Duration ranging is the most popular one, often referred to as the "traditional method" of schedule risk analysis.

It is simple and easy to understand. New and upcoming project managers, leaders, planners, and schedulers would love to wrap their heads around this particular risk-based knowledge area and will enjoy reading this book. It is because one forgets that management tools only facilitate the route and provide quick indicators. The analysis resides mainly under the responsibility of a qualified risk-based project management practitioner like you are. There's no claim whatsoever that the tool will do or can do everything upon command. It is vital to know the process and understand the reference benchmarks employed in addition to being tool-savvy.

The tool is a vehicle to get you where you need to be, quicker and more accurate. One must use the toolset to the "tool's right" for the project to succeed, to set it up correctly for speedy and correct turnarounds less those manual errors. I have observed that some will pretend to know the quantitative tool and the processes involved in the company's detriment. Some slice and dice things, although they have no clear idea what they're doing. It's time for all practitioners to sharpen the saw, know what is needed, why they are doing what they are doing, and finally, for the more qualified persons, perform what's rightfully their area, schedule quantitative expertise risk

I promised myself about three years ago that I will write a book on traditional SQRA. I have done it most shortly, and so everyone can understand. Through this book, you can learn at your own pace. Each Lesson uncovers a specific aspect of risk analysis. It discusses fundamental knowledge in the tool (OPRA) and related risk-based processes. apprehension, with the absence of doubt and anxiety, because you executed the steps correctly. You are doing it right! The traditional quantification technique is also called the three-point estimating method by many risk management practitioners. It looks at risk events and estimates uncertainties using three values of a given value, such as duration, quantity, and cost. The traditional method is applicable to cost risk analysis. It is excellent in capturing time-bound cost elements. The skills needed to perform SQRA have eluded many, even as they try to utilize the tool effectively. A practical treatise on the processes and standards required for the effective time management of major construction projects This book uses logical step-by-step procedures and examples from inception and risk appraisal—through design and construction to testing and commissioning—to show how an effective and dynamic time model can be used to manage the risk of delay in the completion of construction projects. Integrating with the CIOB major projects contract, the new edition places increased emphasis on the dynamic time model as the way to manage time and cost in major projects, as opposed to the use of a static target baseline program. Talk with a few CEOs and non-technical VPs. Ask how their organizations handle projects. If they refer you to a project manager or the training department, you can be relatively sure they are operating with a one-legged stool. And their enterprise is likely wobbling from low employee engagement, late-to-market products, budget overruns, or other difficulties. The leaders of project-driven organizations view "projects" as the main structure through which work gets accomplished. They recognize that mission-critical projects can exist anywhere in a company-IT, R&D, Manufacturing, HR, Sales, Marketing, Financial, you name it. This means every employee in the organization has a role in producing great project outcomes. These leaders consciously engineer hiring practices, work processes, and

In *Mordin On Time*, Nick Mordin sets out his method for answering the most fundamental question facing punters in any race, namely: which is the fastest horse? He was timing the sections of races with a stop watch, estimating wind strength and direction, adjusting for movements of running rails, using projected times and calculating average times years before the best-selling American books on speed rating were published. This new edition incorporates much new material, including standard times for all Irish racecourses (plus the major French ones).

The husband and wife syllogism of planning and scheduling is a good analogy. It was an ideal and fundamental point of view of interdependence.

Planning and scheduling are from a single fabric.

They are very much connected. We plan to schedule, we schedule to plan. Nobody could deny or ignore this deep-rooted relationship (Frago, P50 Risk-based Baseline Schedule, 2014). Every time someone talks about a plan, he will have to talk about the schedule, for what is a plan without thinking about the schedule? The plan is the schedule's shadow and

vice versa. There is no going around it if one is serious about his objectives. It is like Mutt and Jeff, Batman and Robin, one and zero, plus and minus, where each one provides better appreciation of the other. The concept applies to all aspects of life's undertakings. It is difficult not to frown when anyone say, "Focus on planning. Forget about scheduling. All you need is to be a good planner." Say your water heater at home has just crossed its twelve-year usage. You and your wife reflected on it, studied your budget and after looking at the equipment maintenance history, concluded that it needs replacement. After looking up how much it

cost, both of you agreed to replace it next year. In the meantime, you also plan to save enough money pay for the equipment and its installation. The question of timing follows right away in cascading level of details to answer the question when. From the plan, the purchase and installation can be set for August next year. It can be the first Monday of August next year, or August 10 (10 am to 12 pm) next year. A scheduled monthly saving of CAD 200 must be put in place such that the amount by August next year is more than enough to pay for the water heater installation cost. In particular, most of what is written focuses either on the very high-level consideration of requirements frameworks and elicitation techniques, or on the very low-level activities such as the syntax of good requirement statements. It is important to understand these issues, but it is also important to address what are arguably
