In recent years, Nikon has begun to develop and sell a new range of smaller, high-quality digital cameras that are for fit for day-to-day usage. Though they are relatively new to this area of the camera world, and despite the fact that sales for these models are on a general decline throughout the market, Nikon's products are quickly taking off and becoming some of the best-sellers in the field. Some of the better models come from their Coolpix range, which come in five different lines based on their nest usage: A, the flagship series; AW, the all-weather series; L, the life series; P, the performance series; and S, the style series. This book will focus entirely on one of the cameras in the P series: the Nikon Coolpix P330, which was first released in March of 2013. Read up on all of its incredible features, and see what makes it the perfect fit for those looking to find a digital camera with amazing quality and the

perfect compact size.

This sixth edition updates and expands the edition published in 1985. It describes and indexes by subject nearly 500 individuals, companies, museums, and institutions that offer slides of art and/or architecture for sale, rent, or exchange. It also evaluates the quality of the slides offered, the completeness and accuracy of the identifying information, and the services rendered in filling orders. It includes detailed up-to-date information on sources, selection and use of virtually every major type, brand, and model on today's market, a truly invaluable treasure-trove of information and helpful advice for all amateur astronomers. Technical developments, including the Internet, have also made it possible for amateur astronomers to make a real contribution to science by working with professionals. Selecting the right device for a variety of purposes can be an overwhelming task in a market crowded with observing options, but this comprehensive guide clarifies the process. Anyone planning to purchase binoculars or telescopes for astronomy – whether as a first instrument or an upgrade to the next level – will find this book a treasure-trove of information and advice. The contents of this volume reflect to a large extent the efforts made by a group of Institutes at the ETH Zürich to develop new techniques for measurements of flows in fluids

in the last decade. The motivation came from the study of transport and mixing processes in natural and industrial systems. One of the characteristic properties of turbulence is its high mixing efficiency. The techniques developed are therefore suitable, although not exclusively, for turbulence measurements. They can be subdivided into point-measurements and field-measurements. The aim of the point-measurements developed is to determine the three components of the velocity and all their first derivatives with good temporal resolution and accuracy in turbulent flows. The old and well established method of hot-wire anemometry was used for this purpose. One of the main achievements in this context is the construction of miniature multi-wire probes. This technique was introduced to the Institute of Hydromechanics and Water Resources Management of ETH Zürich by Profs. A. Tsinober and E. Kit from Tel-Aviv University. This was made possible by the generous financial support by ETH, for which I would like to express my gratitude on this occasion. In addition, Dr. F.E. Joergensen from DANTEC contributed an example of recent developments in the hardware of Constant Temperature Anemometry (CTA), for which I am very thankful.
