masterpieces from all over the world and covers 700 years of architectural history. Here is Brunelleschi, who built the unbuildable dome of Florence Cathedral; Sinan, a Christian engineer who became chief architect to the Ottoman court; Joseph Paxton, scribbling down a design for the Crystal Palace, London, on a piece of blotting paper; and James Bogardus, an early American evangelist of the opportunities offered by cast-iron architecture. Rapid advances in industrial production inspired experiments with new materials and techniques, gradually allowing a whole new architecture to emerge: reinforced concrete, plate glass and steel were central to the creations of Le Corbusier, Auguste Perret and Mies van der Rohe, for instance; and, in the High-Tech architecture of the present day represented by Norman Foster, Frank Gehry and Santiago Calatrava, among others computer-aided design has seemingly tested the boundaries of the possible.

three decades old, is interdisciplinary in nature whose boundaries are still expanding. However, it draws its core strength from several acknowledged and diverse areas such as computer graphics, differential geometry, Boolean algebra, computational geometry, topological spaces, numerical analysis, mechanics of solids, engineering design and a few others. CAED also needs to show its strong linkages with Computer Aided Manufacturing (CAM). As is true with any growing discipline, the literature is widespread in research journals, edited books, and conference proceedings. Various textbooks have appeared with different biases, like geometric modeling, computer graphics, and CAD/CAM over the last decade. This book goes into mathematical foundations and the core subjects of CAED without allowing itself to be overshadowed by computer graphics. It is written in a logical and thorough manner for use mainly by senior and graduate level students as well as users and developers of CAD software. The book covers (a) The fundamental concepts of geometric modeling so that a real understanding of designing synthetic surfaces and solid modeling can be achieved. (b) A wide spectrum of CAED topics such as CAD of linkages and machine elements, finite element analysis, optimization. (c) Application of these methods to real world problems.
