An inquiry into science education is an exploration into education in a context that is grounded and significant. It is written by a college professor of Physics and Science Education who spent sabbatical year as a full time science teacher in a neighborhood high school in a poor area of New York City. His varied experiences highlight the contrast of what science education is and what it can be. The framework through which the book is written is that science education should be an active, purposeful process which promotes functional understanding and critical thinking. Science learners should be given the opportunity to build an understanding of benchmark principals of science based on their own observations and reasoning. In much the same way, this book explores benchmark principals of science education through real classroom experiences. Standard approaches of teaching and assessment are presented and alternative opportunities are described. Theories and strategies of science education emerge from analysis of classroom observations. Although the focus is on the teaching and learning of science, the subtext is implications of a failing educational system and what can be done about it. The primary intended audience is educators of all capacities, but particularly science teachers. An inquiry into science education integrates critical topics of science education in a contextualized, accessible, and easy to read narrative. The secondary intended audience is non-fiction readers. This book examines educational issues relevant to a general audience from the perspective of a scientist with a focus on inquiry and reasoning. Critical issues are addressed through case histories, some with touches of humor, but all with insight into children and learning.

This book provides new insights on the study of global environmental changes using the ecoinformatics tools and the adaptive-evolutionary technology of geoinformation monitoring. The main advantage of this book is that it gathers and presents extensive interdisciplinary expertise in the parameterization of global biogeochemical cycles and other environmental processes in the context of globalization and sustainable development. In this regard, the crucial global problems concerning the dynamics of the nature-society system are considered and the key problems of ensuring the system's sustainable development are studied. A new approach to the numerical modeling of the nature-society system is proposed and results are provided on modeling the dynamics of the system's characteristics with regard to scenarios of anthropogenic impacts on biogeochemical cycles, land ecosystems and oceans. The main purpose of this book is to develop a universal guide to information-modeling technologies for assessing the function of environmental subsystems under various climatic and anthropogenic conditions.

For scientist and layman alike this book provides vivid evidence that the Copernican Revolution has by no means lost its significance today. Few episodes in the development of

scientific theory show so clearly how the solution to a highly technical problem can alter our basic thought processes and attitudes.

Earth science is the study of Earth and space. It is the study of such things as the transfer of energy in Earth's atmosphere; the evolution of landforms; patterns of change that cause weather; the scale and structure of stars; and the interactions that occur among the water, atmosphere, and land. Earth science in this book is divided into four specific areas of study: geology, meteorology, astronomy, and oceanography. - p. 8-9.

One afternoon in late April 1859 two geologically minded businessmen, John Evans and Joseph Prestwich, found and photographed the proof for great human antiquity. Their evidence — small, hand-held stone tools found in the gravel quarries of the Somme among the bones of ancient animals — shattered the timescale of Genesis and kicked open the door for a time revolution in human history. In the space of a calendar year, and at a furious pace, the relationship between humans and time was forever changed. This interpretation of deep human history was shaped by the optimistic decade of the 1850s, the Victorian Heyday in the age of equipoise. Proving great human antiquity depended on matching the principles of geology with the personal values of scientific zeal and perseverance; qualities which time-revolutionaries such as Evans and Prestwich had in abundance. Their revolution was driven by a small group of weekend scientists rather than some great purpose, and it proved effective because of its bonds of friendship stiffened by scientific curiosity and business acumen. Clive Gamble explores the personalities of these time revolutionaries and their scientific co-collaborators and adjudicators — Darwin, Falconer, Lyell, Huxley, and the French antiquary Boucher de Perthes — as well as their sisters, wives, and nieces Grace McCall, Civil Prestwich, and Fanny Evans. As with all scientific discoveries getting there was often circuitous and messy; the revolutionaries changed their minds and disagreed with those who should have been allies. Gamble's chronological narrative reveals each step from discovery to presentation, reception, consolidation, and widespread acceptance, and considers the impact of their work on the scientific advances of the next 160 years and on our fascination with the shaping power of time.

Project Earth Science: Astronomy, Revised 2nd Edition, involves students in activities that focus on Earth's position in our solar system. How do we measure astronomical distances? How can we look back in time as we gaze across vast distances in space? How would our planet be different without its particular atmosphere and distance to our star? What are the geometries among Earth, the Moon, and the Sun that yield lunar phases and seasons? Students explore these concepts and others in 11 teacher-tested activities.

Earth Science Review Book is user friendly for both the teacher and the student. Since the content is aligned with the New York State Core Curriculum for Physical Setting/Earth Science, a teacher can feel confident that all the required topics are sufficiently developed. The suggested outline of units moves from the concrete material to the more abstract subjects such as meteorology and astronomy. Throughout the book there is ample opportunity for review of basic skills and ways to tie in the various units. For example, isolines are discussed early in the year and then revisited later in the weather topics. The student has

the opportunity to use the book as both a reference and a workbook. The extensive number of constructed response items as well as multiple choice questions found interspersed within the topics give ample practice. The multiple Regents Exams found at the back of the book can be used both at the end of the course for review and whenever appropriate throughout the year.
