Some of the Noble Deeds for which the Medal Has Been Awarded, Described by Those who Have Won It, 1861-1866

An intense, quirky, and feverishly absorbing account of Leo's journey from urban conformity to a wilderness homestead in Alaska. Ten years ago, with little more than a dream, \$900, and a game if wary girlfriend, Leo abandoned the safe path seemingly assured for Harvard-educated children of privilege in order to try to live "way out at the edges instead of just traveling through." Unfolding with almost hallucinogenic fervor, this is the intimate, often quite beautiful record of his improbable success. Starting out with virtually no survival skills, this latter-day "pilgrim" manages to master such anachronistic necessities as building a house from self-cut logs, handling a dog team, and climbing glacial peaks as he

moves from N.Y.C. to ramshackle Talkeetna (pop. 200) and on his own ridge--with "no people or roads for a hundred square miles"--Nestled in the land below Mt. McKinley.

This book provides an overview of polymer nanocomposites and hybrid materials with polyhedral oligomeric silsesquioxanes (POSS). Among inorganic nanoparticles, functionalized POSS are unique nano-building blocks that can be used to create a wide variety of hybrid and composite materials, where precise control of nanostructures and properties is required. This book describes the influence of incorporation of POSS moieties into (organic) polymer matrices on the mechanical, thermal and flammability behavior of composites and hybrid organic-inorganic materials. Importantly, POSS-containing materials can be bio-functionalized by linking e.g. peptides and growth factors through appropriate surface modification in order to enhance the haemo-compatibility of cardiovascular devices made of these materials. This volume includes descriptions of synthesis routes of POSS and POSS-containing polymeric materials (e.g. based on polyolefines, epoxy resins and polyurethanes), presentation of POSS' role as flame retardants and as biocompatible linker, as well as the depiction of decomposition and ageing processes.

When Twilight Weaves Her Gentle Spell

Boron has all the best tunes. That may well be the first impression of the Group 13 elements. The chemical literature fosters the impression not only in the primary journals, but also in a steady outflow of books focussing more or less closely on boron and its compounds. The same preoccupation with boron is apparent in the coverage received by the Group 13 elements in

the comprehensive and regularly updated volume of the Gmelin Handbook. Yet such an imbalance cannot be explained by any inherent lack of variety, interest or consequence in the 'heavier elements. Aluminium is the most abundant metal in the earth's crust; in the industrialised world the metal is second only to iron in its usage, and its compounds can justifiably be said to touch our lives daily - to the potential detriment of those and other lives, some would argue. From being chemical curios, gallium and indium have now gained considerably prominence as sources of compound semiconductors like gallium arsenide and indium antimonide. Nor is there any want of incident in the chemistries of the heavier Group 13 elements. In their redox, coordination and structural properties, there is to be found music indeed, notable not always for its harmony but invariably for its richness and variety. This book seeks to redress the balance with a definitive, wide-ranging and up-to-date review of the chemistry of the Group 13 metals aluminium, gallium, indium and thallium.
