This open access book comprehensively covers the fundamentals of clinical data science, focusing on data collection, modelling and clinical applications. Topics covered in the first section on data collection include: data sources, data at scale (big data), data stewardship (FAIR data) and related privacy concerns. Aspects of predictive modelling using techniques such as classification, regression or clustering, and prediction model validation will be covered in the second section. The third section covers aspects of (mobile) clinical decision support systems, operational excellence and value-based healthcare. Fundamentals of Clinical Data Science is an essential resource for healthcare professionals and IT consultants intending to develop and refine their skills in personalized medicine, using solutions based on large datasets from electronic health records or telemonitoring programmes. The book's promise is "no math, no code" and will explain the topics in a style that is optimized for a healthcare audience.

Commissioned by the Department of Health and Human Services, Key Capabilities of an Electronic Health Record System provides guidance on the most significant care delivery-related capabilities of electronic health record (EHR) systems. There is a great deal of interest in both the public and private sectors in encouraging all health care providers to migrate from paper-based health records to a system that stores health information electronically and employs computer-aided decision support systems. In part, this interest is due to a growing recognition that a stronger information technology infrastructure is integral to addressing national concerns such as the need to improve the safety and the quality of health care, rising health care costs, and matters of homeland security related to the health sector. Key Capabilities of an Electronic Health Record System provides a set of basic functionalities that an EHR system must employ to promote patient safety, including detailed patient data (e.g., diagnoses, allergies, laboratory results), as well as decision-support capabilities (e.g., the ability to alert providers to potential drug-drug

interactions). The book examines care delivery functions, such as database management and the use of health care data standards to better advance the safety, quality, and efficiency of health care in the United States.

This important volume provide a one-stop resource on the SAFER Guides along with the guides themselves and information on their use, development, and evaluation. The Safety Assurance Factors for EHR Resilience (SAFER) guides, developed by the editors of this book, identify recommended practices to optimize the safety and safe use of electronic health records (EHRs). These guides are designed to help organizations self-assess the safety and effectiveness of their EHR implementations, identify specific areas of vulnerability, and change their cultures and practices to mitigate risks. This book provides EHR designers, developers, implementers, users, and policymakers with the requisite historical context, clinical informatics knowledge, and real-world, practical guidance to enable them to utilize the SAFER Guides to proactively assess the safety and effectiveness of their electronic health records EHR implementations. The first five chapters are designed to provide readers with the conceptual knowledge required to understand why and how the guides were developed. The next nine chapters focus on the underlying informatics concepts, key research activities, and methods used to develop each of the guides. Each of these chapters concludes with a copy of the guide itself. The final chapter provides a vision for the future and the work required to ensure that future generations of EHRs are designed, developed, implemented, and used to improve the overall safety of the EHR-enabled healthcare system. Taken together, the information provided in this book should help any organization, whether large or small, implement its EHR program and improve the safety and effectiveness of its existing EHR-enabled healthcare systems. This volume will be extremely valuable to small, ambulatory physician practices and larger outpatient settings as well as for hospitals and professors and instructors charged with teaching safe and effective implementation and use of EHRs. It will also be highly useful for health information technology professionals responsible for maintaining a safe and effective EHR and for clinical and administrative staff working in EHR-enabled

healthcare systems.

The NHA Electronic Health Records Specialist Certification Exam aims at assessing the competencies of the Electronic Health Records Specialist. The exam tests the knowledge and abilities to effectively manage medical records in different healthcare settings. The exam has multiple-choice items covering these topics: - Demonstrate knowledge of the health care delivery system and medical terminology. - Demonstrate an understanding of the transition to an Electronic Health Record (EHR). - Demonstrate the ability to maintain an EHR within a physician's office. - Demonstrate the ability to maintain an EHR within a hospital setting. - Demonstrate an understanding of the usage of personal health records. - Demonstrate knowledge of compliance and ethics. - Demonstrate an understanding of the Practice Partner (the ambulatory EHR). This book focuses on the technology topics of the exam.

This User's Guide is intended to support the design, implementation, analysis, interpretation, and quality evaluation of registries created to increase understanding of patient outcomes. For the purposes of this guide, a patient registry is an organized system that uses observational study methods to collect uniform data (clinical and other) to evaluate specified outcomes for a population defined by a particular disease, condition, or exposure, and that serves one or more predetermined scientific, clinical, or policy purposes. A registry database is a file (or files) derived from the registry. Although registries can serve many purposes, this guide focuses on registries created for one or more of the following purposes: to describe the natural history of disease, to determine clinical effectiveness or cost-effectiveness of health care products and

services, to measure or monitor safety and harm, and/or to measure quality of care. Registries are classified according to how their populations are defined. For example, product registries include patients who have been exposed to biopharmaceutical products or medical devices. Health services registries consist of patients who have had a common procedure, clinical encounter, or hospitalization. Disease or condition registries are defined by patients having the same diagnosis, such as cystic fibrosis or heart failure. The User's Guide was created by researchers affiliated with AHRQ's Effective Health Care Program, particularly those who participated in AHRQ's DECIDE (Developing Evidence to Inform Decisions About Effectiveness) program. Chapters were subject to multiple internal and external independent reviews.

The Electronic Health Records Training Manual is a guide in preparing yourself for a career in EHR. This training manual will give you an overview in all areas of Electronic Health Records and prepare you for the National Certification Exam. Contributions by: Rauf Xavier Newman CorSt, AHI, CEHRS

Abstract: There have been several studies based on physician and practice characteristics and their effect on the adoption of Electronic Health Records (EHRs). The signing of the HiTech Act of 2009 has given major incentive for EHR adoption. It was introduced to facilitate the adoption of the new technology as financial readiness was found to be a major barrier. It is very important now to study these factors as they will help policy makers in taking the next step towards the successful adoption of EHR. The focus of this study is the link between patient demographic, physician practice characteristics and EHR adoption. Data and questionnaires from the National Ambulatory Medical Care Survey (NAMCS) of 2008 were used. We performed chi squared test and Spearman's correlation test. We found that there is a statistically significant relationship between patient demographic, the type of ownership of the practice and its size on the decision to adopt new EHR technology. The results show that practices that were owned by community health center and medical academic health centers and were bigger in size showed higher rates of adoption. However, higher patient demographics of Medicare and Medicaid did not lead to adoption. Research shows that EHR adoption is on the rise. In the future, we should establish and test a best practices guide of implementation, develop frameworks for testing organizational readiness and link EMR systems with improvement in quality of care.
