Since its first appearance in 1950, Pounder's Marine Diesel Engines has served seagoing engineers, students of the Certificates of Competency examinations and the marine engineering industry throughout the world. Each new edition has noted the changes in engine design and the influence of new technology and economic needs on the marine diesel engine. Now in its ninth edition, Pounder's retains the directness of approach and attention to essential detail that characterized its predecessors. There are new chapters on monitoring control and HiMSEN engines as well as information on developments in electronic-controlled fuel injection. It is fully updated to cover new legislation including that on emissions and provides details on enhancing overall efficiency and cutting CO2 emissions. After experience as a seagoing engineer with the British India Steam Navigation Company, Doug Woodyard held editorial positions with the Institution of Mechanical Engineers and the Institute of Marine Engineers. He subsequently edited The Motor Ship journal for eight years before becoming a freelance editor specializing in shipping, shipbuilding and marine engineering. He is currently technical editor of Marine Repulsion and Auxiliary Machinery, a contributing editor to Speed at Sea, Shipping World and Shipbuilder and a technical press consultant to Rolls-Royce Commercial Marine. " Helps engineers to understand the latest changes to marine diesel engines " Careful organisation of the new edition enables readers to access the information they require " Brand new chapters focus on monitoring control systems and HiMSEN engines. " Over 270 high quality, clearly labelled illustrations and figures to aid understanding and help engineers quickly identify what they need to know. The method of computing velocity and pressure distributions along wing profiles under the assumption of the simplified density-speed relation, outlined in NACA Technical Note 1006, is extended to the case of a nonsymmetrical profile and a flow with circulation. The shape of the profile, the speed of the undisturbed flow, and a parameter determining the angle of attack may be prescribed. The problem is reduced to a nonlinear integral equation which can be solved numerical by an iteration method. A numerical example is given.

Bring that old Oldsmobile engine back to life with this new, all-color Workbench-edition book. Oldsmobile caught the performance world by surprise when it launched its new overhead valve (OHV) V-8 in 1949 called the Rocket. These engines, along with Cadillac, were the first post-war OHV design produced by General Motors. In a world of flathead V-8 performance, they were a major step forward and an instant hit. As was the norm for all American car manufacturers in the 1950s and 1960s, the Rocket V-8s grew in size and performance capability until the Generation II engines began production in 1964. Offered in a variety of displacements over the 27-year run, the Generation II engine was offered in sizes ranging from 260 to 455 ci, suiting every possible need from reliable fuel economy to all-out performance. In Oldsmobile V-8 Engines 1964-1990: How to Rebuild, veteran author Mike Forsythe takes you through the complete process of rebuilding and restoring your Generation II Rocket V-8 to its original glory. Covered in a thorough step-by-step format are the tools required, the disassembly process, analysis of what went wrong, parts selection and replacement, the machining process, pre-assembly, final assembly, and the break-in process. Some performance upgrade options are also included. The Oldsmobile Generation II engine had a lengthy and productive run not only powering Oldsmobiles but also a variety of Buicks and Pontiacs. If you are in the restoration process or simply want a return to factory-original performance in your Cutlass, Delta 88, Vista Cruiser, Toronado, 98, or 442, this book is an essential tool in bring your Oldsmobile back to its original glory.

Every four years, Schaeffler provides an insight into its latest developments and technologies from the engine, transmission and chassis as well as hybridization and electric mobility sectors. In 2014 the Schaeffler Symposium with the motto "Solving the Powertrain Puzzle" took place from 3th to 4th of April in Baden-Baden. Mobility for tomorrow is the central theme of this proceeding. The authors are discussing the different requirements, which are placed on mobility in different regions. The development, a comprehensive in-house mobility study also provides a reliable basis for the discussion. The authors are convinced that there will be a paradigm shift in the automotive industry. Issues such as increasing efficiency and advancing electrification of the powertrain, automatic and semi-automatic driving, as well as integration in information networks will define the automotive future. In addition, the variety of solutions available worldwide will become increasingly more diverse. The development of electric mobility will mean that cars will drive virtually in the future. Powertrains based on internal combustion engines will still dominate for a very long time and demonstrate new strengths in combination with hybrid drives. Transmissions will also gain in importance as the link between the internal combustion engine and electric motor. The proceeding "Solving the Powertrain Puzzle" contains 34 technical papers from renowned experts and researchers in the field of automotive engineering.
