addresses three
audiences: 1)

those involved in assessing and regulating timber harvesting activities in Southeast Asia, 2) those involved in trying to achieve conservation goals in the region, and 3) those undertaking

management. This
book shows that
forest
management can
be improved in
many simple ways
to allow timber
extraction and
wildlife

conservation to be more compatible than under current practices. The recommendations can also be valuable to the many governmental and non-governmental organisations promoting

sustainable forest management and eco-labelling.

Finally, it identifies a number of shortcomings and gaps in knowledge, which the hope can interest the scientific community and

promote further research. This review is, an important scientific step toward understanding and improving sustainable forestry practices for long-term biodiversity conservation.

Even in the short term, however, significant improvements can be made to improve both conservation and the efficiency of forest management, and there is no need to delay action due to

a perceived lack of information. In the longer term it is expected that the recommendations from this review will be implemented, and that further research will continue to help foster an
