Encyclopedia of Insects

A lavishly photographed, fact-filled introduction to a variety of jumping, crawling and creeping insects expands from backyard favorites, including ladybugs and fireflies, to more exotic species from the world's rain forests and deserts.

Planet Earth. Four elements. One incredible story. We take kids on a rollercoaster ride through history, geography and science to show how four elements - earth, fire, air and water - created the world and everything that exists today. Amazing facts, photography and illustrations bring our planet and its past to life in an exciting, engaging way.

This is a fascinating account of more than eighty insect "firsts." Velcro, bungee jumping, air-conditioning, and chemical warfare are a few of the firsts covered in this book authored by two professional entomologists. The text is illustrated with humorous anthropomorphized insects. It is written for a general audience but is of special interest to teachers and entomologists.

"Creepy, beautiful, icky and amazing." —Penny Le Couteur, author of Napoleon's Button Insects have been shaping our ecological world and plant life for over 400 million years. In fact, our world is essentially run by bugs—there are 1.4 billion for every human on the planet. In Bugged, journalist David MacNeal takes us on an off-beat scientific journey that weaves together history, travel, and culture in order to define our relationship with these mini-monsters. MacNeal introduces a cast of bug-lovers—from a woman facilitating tarantula sex and an exterminator nursing bedbugs (on his own blood), to a kingpin of the black market insect trade and a "maggotologist"—who obsess over the crucial role insects play in our everyday lives. Just like bugs, this book is global in its scope, diversity, and intrigue. Hands-on with pet beetles in Japan, releasing lab-raised mosquitoes in Brazil, beekeeping on a Greek island, or using urine and antlers as means of ancient pest control, MacNeal's quest appeals to the squeamish and brave alike. Demonstrating insects' amazingly complex mechanics, he strings together varied interactions we humans have with them, like extermination, epidemics, and biomimicry. And, when the journey comes to an end, MacNeal examines their commercial role in our world in an effort to help us ultimately cherish (and maybe even eat) bugs.
