Food, Nutrition and Sports Performance III

Abstract: A bibliography of resources for educating and training teachers, school foodservice personnel, and students in nutritional principles covers nutrition education materials developed in the US Nutrition Education and Training (NET) Program as well as citations to literature about the program. A total of 445 citations are grouped according to 17 audience levels (e.g., primary grades (K-3); postsecondary education; foodservice training; adult education), with each citation containing an informative, nonevaluative abstract, a format description, and a Food and Nutrition Information Center (FNIC) number. A listing of names

Appendix

**Written and organized to be accessible to a wide range of readers, *Improving America's Diet and Health* explores how Americans can be persuaded to adopt healthier eating habits. Moving well beyond the "pamphlet and public service announcement" approach to dietary change, this volume investigates current eating patterns in this country, consumers' beliefs and attitudes about food and**

nutrition, the theory and practice of promoting healthy behaviors, and needs for further research. The core of the volume consists of strategies and actions targeted to sectors of society--government, the private sector, the health professions, the education community--that have special responsibilities for encouraging and enabling consumers to eat better. These recommendations form the basis for three principal strategies necessary to further the implementation of dietary recommendations in the United States.

As sport has become more professionalised over the last thirty years, so the role of nutrition in promoting health and performance has become ever more important to athletes who search for the extra edge to succeed in their respective sports. With the expansion in the provision of medical and scientific support services in elite sport, those who advise athletes have had to become adept at identifying those dietary strategies that will help them to outperform their competitors. This book is structured in two parts. The first analyses the science that underpins the nutritional goals of athletes, with a focus on the implications for athletes during training, competition and recovery. The second looks more closely at the practical implications for different sport categories, i.e. those that focus on strength, power or endurance, and on weight category sports, team sports and winter sports. This volume will be of value to sports dieticians and nutritionists and others involved in the care and support of athletes, as well as to those who take an interest in the subject of sport nutrition and competitive performance. Coaches and athletes will also find much of interest here. This book is based on the proceedings of the third in a series of Consensus Conferences in Sports Nutrition organised under the auspices of the International Olympic Committee. It was published as a special issue of the Journal of Sports Sciences.
