The authors of this oral rehabilitation text advocate the controversial Twin-Stage Procedure which they discovered, explaining that it provides the means to control the amount of disocclusion that average doctors using previous procedures have been unable to control. The results of the Twin-Stage Procedure produce precise disocclusion without the measurement of condylar path, and follow gnathological principles of scientifically supported patient treatment. Topics include the articulator, the Twin-Stage Procedure, clinical evaluation test, full mouth reconstruction, fixed restorations and occlusal adjustment, and occlusion for osseointegrated implants.
