Education ... Series
MSCEIS 2019

**Extracellular Matrix
(ECM) has been**

**considered for a long
time merely a scaffold
sustaining cell and
tissue function.**

**Despite this simplistic
view shared by many,
nowadays ECM and
their mechanic-
physical and chemical
characteristic acquired**

a progressive larger role actively regulating cell life: survival, proliferation, gene expression and differentiation. The interplay between cells and the ECM is continuously controlled at the cell level in a dynamic way. While cells synthesize the raw components of the ECM, this in turn

impacts on cell function by providing chemical, topographical and mechanical hints. Such stimuli have been proven to control several aspects of cell function, including survival, proliferation, differentiation and migration. The molecular pathways activated by cells in

response to the physical cues arising from the ECM are being disclosed and thus the possibility to control cell function through materials design is becoming more realistic. Current in vitro protocols, relying in 2D cell culture system, entail reductionist approaches to the

**complexity of cell-
ECM interaction and
result in cells rapidly
losing their distinctive
functions in culture.
Understanding and
replicating the 3D
microenvironmental
cues affecting cell
function appears as a
mandatory
requirement for the
development of next-
generation**

**biomaterials, as well as
for the establishment
of more
physiologically
relevant and predictive
in vitro models of
diseases. Such an
effort will require a
multidisciplinary
approach at the
convergence of
biophysics, biology,
nanotechnology, and
bioengineering.**
