The Wartegg Drawing Completion Test (WDCT) is a semi-structured, graphic, performance-based personality test, created by Ehrig Wartegg (1939). With a foundation in Gestalt and Psychodynamic theory, the WDCT has been used widely throughout Europe, South America, and Japan, but only recently has become available in the United States. Initial scoring systems for the WDCT were considered cumbersome and lacked research-driven validation. In response to these factors, Alessandro Crisi, following years of clinical practice and research, developed the Crisi Wartegg System (CWS; 1998, 2007), a normed and standardized administration, scoring, and interpretation system for the WDCT. Over the past three decades, Dr. Crisi has refined and expanded the CWS through research, broadening the scope of the measure, and increasing the accessibility of the system to clinicians. This manual provides a comprehensive guide to the CWS, made available to English-speaking clinicians for the first time.

The two volumes of the Handbook of Psychological and Educational Assessment of Children, Second Edition, cover all aspects of child and adolescent assessment. designed for reference or text use, this vast knowledge base has been synthesized into two volumes which may be purchased separately or together. INTELLIGENCE, APTITUDE, AND ACHIEVEMENT surveys assessment of intelligence, learning styles, and academic achievement; covers historical issues and psychometric methods; and addresses diversity issues, ethical concerns, and special topics in mental testing. PERSONALITY, BEHAVIOR, AND CONTEXT reviews the use of projective methods, interviewing and observation, and objective methods of assessing personality and behavior; discusses the assessment of specific syndromes and symptoms; and presents tools for assessing adaptive skills and the family context. The Handbook of Research Methods in Early Childhood Education brings together in one source research techniques that researchers can use to collect data for studies that contribute to the knowledge in early childhood education. To conduct valid and reliable studies, researchers need to be knowledgeable about numerous research methodologies. The Handbook primarily addresses the researchers, scholars, and graduate or advanced undergraduate students who are preparing to conduct research in early childhood education. It provides them with the intellectual resources that will help them join the cadre of early childhood education researchers and scholars. The purpose of the Handbook is to prepare and guide researchers to achieve a high level of competence and sophistication, to avoid past mistakes, and to benefit from the best researchers in the field. This Handbook is

The goal of this Handbook is to describe the current assessment strategies and related best practices to professionals who serve individuals from diverse cultures or those who have difficulty using the English language. It will be a valuable resource for school psychologists, special educators, speech and hearing specialists, rehabilitation counselors, as well as graduate-level students of school psychology and child and family psychology.

This publication is a revision and extension of the Goodenough Draw-a-Man Test which has been used to survey the intellectual status of young children. Deaf adults and children, like their hearing counterparts, experience a full range of mental health problems. They develop psychoses, sink into deep depressions, abuse alcohol and drugs, commit sexual offenses, or simply have trouble adjusting to new life situations. But when a deaf client appears on the doorstep of an ordinary hospital, residential facility, clinic, or office, panic often ensues. Mental Health Care of Deaf People: A Culturally Affirmative Approach, offers much-needed help to clinical and counseling psychologists, psychiatrists, social workers, nurses, and

other mental health professionals--and to their program administrators. The editors, a psychologist and a psychiatrist, and the authors, leading authorities with a variety of expertises, systematically review the special needs of deaf patients, particularly those who regard themselves as "culturally Deaf," and provide professionals with the tools they need to meet those needs. Among these tools is an extensive "library" of pictorial questionnaires and information sheets developed by one of the very few psychiatric units in the country devoted to the deaf. These handouts greatly simplify the processes involved in the diagnosis and treatment of people who in many cases are not good readers--for example, explaining medication and inquiring about side-effects. The handouts are reproduced on a CD included in each copy of the book, to enable purchasers to print out and use copies in their work. This comprehensive clinical guide and its accompanying CD constitute vital resources for all those who seek to provide sensitive, effective mental health care to deaf people.

A number of books on economic psychology have appeared in the past few years. The most recent publications are by MacFadyen and Mac Fadyen (1986), Furnham and Lewis (1986), Lea et al. (1987) and Van Raaij et al. (1988). Why produce yet another book for this discipline? This question can be answered in various ways. In a sense, this book is the answer in itself. Its presentation of research and theories is innovative in this field, at least to my knowledge. It attempts to structure the many theories emerging in the interdisciplinary science of economic psychology and to explain the background of the research. The second answer is pragmatic. In our introductory course of economic psychology for economics students at Erasmus University Rotterdam we used several of the above mentioned books. Our experience with this material is that, when preparing our lectures, we had to explain many additional theories and experiments to our students. Furthermore, diagrams, figures and examples had to be culled from other sources or made by ourselves. It is not my intention to run down these publications since I think they provide an excellent treatment of a number of topics by specialists in economic psychology. The plan for the present book, however, emerged from our need to present an

Since publication in its first edition the Handbook of Psychological Testing has become the standard text for organisational and educational psychologists. It offers the only comprehensive, modern and clear account of the whole of the field of psychometrics. It covers psychometric theory, the different kinds of psychological test, applied psychological testing, and the evaluation of the best published psychological tests. It is outstanding for its detailed and complete coverage of the field, its clarity (even for the non-mathematical) and its emphasis on the practical application of psychometric theory in psychology and education, as well as in vocational, occupational and clinical fields. For this second edition the Handbook has been extensively revised and updated to include the latest research and thinking in the field. Unlike other work in this area, it challenges the scientific rigour of conventional psychometrics and identifies groundbreaking new ways forward.

these pages are approachable and can be invaluable for understanding our very technical world and the increasing flow of information. Although there are references that cover statistics and assessment in depth, none provides as comprehensive a resource in as focused and accessible a manner as the three volumes of this Encyclopedia. Through approximately 500 contributions, experts provide an overview and an explanation of the major topics in these two areas. There is a considerable amount of interest within pediatrics and primary health care that is currently being directed toward the behavioral and emotional problems of childhood. Traditionally, these areas have been emphasized by child psychiatrists, child psychologists, and psychiatric social workers. Now, however, the detection and, in some cases, the assessment and treatment of children with these types of disturbances fall within the province of primary child health care professionals. Even when the child psychiatrist or child psychologist provides the primary mental health treatment for the child, specialists such as pediatricians, family physicians, pediatric nurses, pediatric nurse practitioners, and speech therapists remain instrumental in support of the ongoing psychotherapeutic process as providers of some other aspect of total health care to the child and family. For these pediatricians, family physicians, and other nonpsychologist primary health care providers, it is essential to acquire an understanding and effective working knowledge of important psychological information and concepts to utilize within their own framework and professional responsibilities. In

order that this may be accomplished, these professionals with limited backgrounds in psychology must better understand how psychologists themselves assess children and how they derive the conclusions reflected in the statements and reports that are shared with members of their own and other disciplines. In short, nonpsychologists must become substantially more familiar with psychological assessment, particularly with psychological testing and the subsequent reporting of results.

The Special Educator's Comprehensive Guide to 301 Diagnostic Tests

Dictionary of Communication Disorders

This edited volume presents a balanced approach to the ongoing debate of just how general the "general factor" of intelligence is. To accomplish this goal, the editors chose a number of distinct approaches to the study of intelligence--psychometric, genetic-epistemological, cognitive, biological, behavior-genetic, sociocultural, systems--and asked distinguished scholars to write from the standpoint of these approaches. Each approach comprises two chapters, one by a scholar leaning toward a view arguing for the greater generality of g, and the other by a scholar leaning toward a view arguing for the lesser generality of g. The scholars are not simply "for" or "against" these outlooks, rather they provide a more textured view of the general factor, attempting to explain it in psychological terms that are easily understandable. Intended for psychologists in all areas, including clinical, consulting, educational, cognitive, school, developmental and industrial-organizational, this book will also be of interest to educators, sociologists, anthropologists, and those interested in the nature of intelligence.

questions of interest. Not only will professionals learn to develop new tests, but they will also increase their understanding of the process of test development for instruments which are already available.

From foreword: Few psychological variables affecting the lives of children are given as much emphasis by mental health professionals and the general public as self-esteem. Psychoanalyst Harry Stack Sullivan viewed the concept of self as the "bedrock of the human personality," and a deterioration in self-esteem has long been associated by both clinicians and researchers with a wide range of difficulties - from depression and delinquency to eating disorders and school failure. The message has not been lost on parents and teachers, who constantly search for ways to improve the motivation and well-being of their children by helping them enhance their self-concept. As one popular book on the subject tells its readers, self-esteem is no less than the "mainspring that slates every child for success or failure as a human being." Careful observations of the child tend to reinforce the validity of such views-and thus the importance of this unusually rich volume.
