As seen in Star Wars: The Last Jedi, welcome to the casino city of Canto Bight. A place where exotic aliens, captivating creatures, and other would-be high rollers are willing to risk everything to make their fortunes. Set across one fateful evening, these four interconnected stories explore the deception and danger of the lavish casino city. • An honest salesman meets a career criminal as a dream vacation turns into the worst nightmare imaginable, in a story by Saladin Ahmed. • Dreams and schemes collide when a deal over a priceless bottle of wine becomes a struggle for survival, as told by Mira Grant. • Old habits die hard when a servant is forced into a mad struggle for power among Canto Bight's elite, in a tale by Rae Carson • A deadbeat gambler has one last chance to turn his luck around; all he has to do is survive one wild night, as told by John Jackson Miller. In Canto Bight, one is free to revel in excess, untouched from the problems of a galaxy once again descending into chaos and war. Dreams can become reality, but the stakes have never been higher—for there is a darkness obscured by all the glamour and luxury.

Pricing drives three of the most important elements of firm success: revenue and profits, customer behavior and firm image. This book provides an introduction to the basic principles for thinking clearly about pricing. Unlike other marketing books on pricing, the authors use a more analytic approach and relate ideas to the basic principles of microeconomics. Rakesh Vohra and Lakshman Krishnamurthi also cover three areas in greater depth and provide more insight than may be gleaned from existing books: 1) the use of auctions, 2) price discrimination and 3) pricing in a competitive environment.

These transactions publish research in computer-based methods of computational collective intelligence
(CCI) and their applications in a wide range of fields such as the semantic Web, social networks, and
multi-agent systems. TCCI strives to cover new methodological, theoretical and practical aspects of CCI
understood as the form of intelligence that emerges from the collaboration and competition of many
individuals (artificial and/or natural). The application of multiple computational intelligence
technologies, such as fuzzy systems, evolutionary computation, neural systems, consensus theory, etc.,
aims to support human and other collective intelligence and to create new forms of CCI in natural and/or
artificial systems. This twentieth issue contains 11 carefully selected and revised contributions.
The power of mapping: principles for visualizing knowledge, illustrated by many stunning large-scale,
full-color maps. Maps of physical spaces locate us in the world and help us navigate unfamiliar routes.
Maps of topical spaces help us visualize the extent and structure of our collective knowledge; they
reveal bursts of activity, pathways of ideas, and borders that beg to be crossed. This book, from the
author of Atlas of Science, describes the power of topical maps, providing readers with principles for
visualizing knowledge and offering as examples forty large-scale and more than 100 small-scale full-
color maps. Today, data literacy is becoming as important as language literacy. Well-designed
visualizations can rescue us from a sea of data, helping us to make sense of information, connect ideas,
and make better decisions in real time. In Atlas of Knowledge, leading visualization expert Katy Börner
makes the case for a systems science approach to science and technology studies and explains different
types and levels of analysis. Drawing on fifteen years of teaching and tool development, she introduces
a theoretical framework meant to guide readers through user and task analysis; data preparation,
analysis, and visualization; visualization deployment; and the interpretation of science maps. To
exemplify the framework, the Atlas features striking and enlightening new maps from the popular "Places
& Spaces: Mapping Science" exhibit that range from "Key Events in the Development of the Video Tape
Recorder" to "Mobile Landscapes: Location Data from Cell Phones for Urban Analysis" to "Literary
Empires: Mapping Temporal and Spatial Settings of Victorian Poetry" to "Seeing Standards: A
Visualization of the Metadata Universe." She also discusses the possible effect of science maps on the
practice of science.
