In response to a request from the Director of the Virginia Department of Transportation Safety an evaluation of the state and federal regulations, inspection programs and enforcement activities regarding truck safety was carried out. The purpose of the study was to assess the nature and scope of current regulatory activities; to compare and contrast state and federal approaches; and to ascertain whether or not a problem exists with state regulations, inspections, and enforcement and, if so, to suggest remedial measures. The study was carried out with guidance provided by a project advisory group consisting of representatives of the Department of Highways and Transportation, Division of Motor Vehicles, Department of State Police, Department of Health, Office of Energy and Emergency Services, State Corporation Commission, Port Authority, Division of Legislative Services, Office of the Attorney General, U. S. Bureau of Motor Carrier Safety, National Transportation Safety Board, and the Virginia Highway Users Association. The evaluation included a review of relevant literature, a questionnaire survey of other states, site visits and observations of SCC and BMCS on-road safety inspections, a review and comparison of state and federal laws and regulations, and an analysis of available data concerning truck accidents. Analysis of the information obtained led to the. Conclusion that some revisions to the regulatory provisions governing the trucking industry and the transportation of hazardous materials are warranted.

Recommendations for the revision of Virginia's regulations and administrative programs are offered.

Contains summaries of the knowledge regarding the effects of 128 road safety measures. This title covers various areas of road safety including: traffic control; vehicle inspection; driver training; publicity campaigns; police enforcement; and, general policy instruments. The Handbook of Road Safety Measures

Research indicates that up to 28% of crashes are due to the road environment. The most important objective of road safety audit is to minimize crashes, and to minimize the severity of any crashes that may occur on a new road project. The series of CAREC road safety engineering manuals came from the endorsement of the CAREC Road Safety Strategy 2017 – 2030 by member countries. The strategy supports and encourages CAREC authorities to plan, design, construct, and maintain safe roads. This manual also explains the road safety audit process as it can apply in CAREC road projects. It provides information about the audit process for those who undertake the audits (practitioners) and for those who manage the audit process (policy makers).

Geographic data is a valuable source of information in modern society. By utilizing alternative sources of this data, the availability and potential applications of geographic information systems can be increased. Volunteered Geographic Information and the Future of Geospatial Data is a pivotal reference source for the latest scholarly research on information gathering from volunteers, as opposed to official agencies and private companies, to compile geospatial data. Highlighting a range of pertinent topics such as regional landscape mapping, road safety, and land usage, this book is ideally designed for researchers, academics, students, professionals, and practitioners interested in the growing area of volunteered geographic information.

This manual explains how to provide safer road worksites on CAREC roads. It explains good practices for roadwork sites, offering clear and simple guidance for CAREC road authorities to use to improve road safety at these sites for road users and workers alike. It offers information about the six-zone process, how to plan and implement a traffic management plan, and how to manage a safe worksite. This manual is essential reading for project managers, designers, supervision consultants, contractors, works supervisors and others who have a responsibility for safe worksites.

A Study Guide for the Operator Certificate of Professional Competence (CPC) in Road Freight 2018 is a vital study guide that offers the thorough preparation needed to pass the tough CPC exams in the UK. It covers the examination method used by the Oxford, Cambridge and RSA (OCR) and the Chartered Institute of Logistics and Transport (CILT).

This is the Level 3 standard qualification overseen by The Office of Qualifications and Examinations Regulation (OFQUAL) and the Welsh Assembly Government, which is required by any person wishing to operate vehicles over 3,500 kg, the maximum authorised mass for hire and reward, in the UK and internationally. A Study Guide for the Operator Certificate of Professional Competence (CPC) in Road Freight 2018 has been extensively revised to include all the new legislation. It covers the eight study sections that the directive requires: civil law; commercial law; social law; fiscal law; business; financial; management of the undertaking access to the market; technical standards and technical aspects of the operation road safety. It features many case studies, examples, diagrams and graphics. New to this edition: test questions after each section.

The purpose of this manual is to provide clear and helpful information for maintaining gravel roads. Very little technical help is available to small agencies that are responsible for managing these roads. Gravel road maintenance has traditionally been "more of an art than a science" and very few formal standards exist. This manual contains guidelines to help answer the questions that arise concerning gravel road maintenance such as: What is enough surface crown? What is too much? What causes corrugation? The information is as nontechnical as possible without sacrificing clear guidelines and instructions on how to do the job right.

This comprehensive 2nd edition covers the key issues that relate human behavior to traffic safety. In particular it covers the increasing roles that pedestrians and cyclists have in the traffic system; the role of infotainment in driver distraction; and the increasing role of driver assistance systems in changing the driver-vehicle interaction.

The objective of this study was to evaluate with field tests, a procedure developed for the Federal Highway Administration for determining frequencies at which highway safety hardware needs to be inspected and repaired. The frequencies arrived at were based on the accident history of the safety hardware and the level of service to be provided, which is based on the probability of completing the inspection and repair before a subsequent accident. It was concluded that the procedure was a useful method for highway safety hardware maintenance guidelines. Some problems were noted and suggestions were made to resolve them.
