This book examines the complex ways in which television articulates ideas about DNA in the early 21st century. Considering television’s distinct aesthetic and narrative forms, as well as its specific cultural roles, it identifies TV as a key site for the genetic imaginary. The book addresses the key themes of complexity and kinship, which function as nodes around which older essentialist notions about the human genome clash with newly emergent post-genomic sensibilities. Analysing a wide range of US and UK programmes, from science documentaries, science fiction series and crime procedurals, to family history programmes, sitcoms and reality shows, Television and the Genetic Imaginary illustrates the extent to which molecular frameworks of understanding now permeate popular culture.

Wouldn't you like... Products that don't damage the environment? - A better way of life without agonising about your 'footprint'? - To really know your stuff? Climate change? Biofuels? Nuclear power? Landfills? Recycling? Renewable energy? Environmental issues can feel overwhelming. But, in fact, it is simple; it all comes down to one thing - stuff. Our use of the Earth's resources - whether a crisp packet or a cargo ship, a T-shirt or a wind turbine - has an inescapable impact on our future. In The Secret Life of Stuff, Julie Hill uncovers the origins and the true cost of what we use. Her inventory of over-consumption may shock but it is the first step towards overcoming waste. The misuse of stuff is not your fault, it's a product of history. But it is only by understanding what has gone wrong, that everyone - politicians, business people and us as consumers - can create a new and better material world.

A story of awakening to remarkable shamanic powers, teachings, and techniques - Describes the author's work with plant spirits, entheogens such as ayahuasca, and indigenous shamans during his 20 years of fieldwork in the Peruvian Amazon - Explores the practice of soul retrieval and shamanic work with feathers, stones, and sound - Includes techniques for exploring non-ordinary reality, exercises for expanding sensory perception, and practices to open your creative artistic visionary potential After surviving a serious elevator crash in London, Howard G. Charing found he had developed healing touch as well as the ability to hear voices and experience visions—just as a healer in Italy had predicted only a week before the accident. He began using his abilities to heal but felt he needed more guidance and training. He first connected with a national spiritual healing organization, only to told he was doing everything wrong. Then, through a friend, he discovered shamanism. Sharing profound teachings and extraordinary experiences from his more than 30 years of shamanic healing work, Charing explains how he accidentally became a shaman and completely changed the course of his life. He describes his work with plant spirits, entheogens such as ayahuasca, and indigenous shamans during his 20 years of fieldwork in the Peruvian Amazon, including his studies with the late visionary artist Pablo Amaringo. Investigating altered states of perception, he provides visionary techniques for exploring non-ordinary reality, exercises for expanding sensory perception, and practices to open your creative artistic visionary potential. Detailing the practice of soul retrieval, the author discusses why it is one of the most effective and profound spiritual healing practices and shares emotionally charged stories of successful shamanic healings he has attended. He also includes shamanic wisdom on working with feathers, stones, and sound and compares current research in physics with the vast body of experiential knowledge from indigenous spiritual traditions. From the accident that started his journey to the many remarkable spiritwork encounters that have happened since, Charing's story will empower readers to begin exploring the realms of consciousness and energy that surround us and welcome the dissolution of the boundary between the physical and the spiritual.

"Mrs. Packard says that because she expressed 'obnoxious views' in Sunday School at the Old School Presbyterian Church in Manteno, Kankakee County, Illinois, her husband of twenty-one years and father of her six children, the Reverend Theophilus Packard, 'abducted' her and took her to the asylum and had her incarcerated (which was legal per Illinois statute of 1851). She faithfully recorded events of her imprisonment - for that is what it was - and declares that what happened to her was not uncommon. The conditions, attitudes and behavior she describes are dreadful and extreme - and not much improved twelve decades later" -- insert provided by seller.

An iconoclast and best-selling author of both nonfiction and fiction, Elizabeth Marshall Thomas has spent a lifetime observing, thinking, and writing about the cultures of animals such as lions, wolves, dogs, deer, and humans. In this compulsively readable book, she provides a plainspoken, big-picture look at the commonality of life on our planet, from the littlest microbes to the largest lizards. Inspired by the idea of symbiosis in evolution—that all living things evolve in a series of cooperative relationships—Thomas takes readers on a journey through the progression of life. Along the way she shares the universal likenesses, experiences, and environments of “ Gaia ’ s creatures, ” from amoebas in plant soil to the pets we love, from proud primates to Homo sapiens hunter-gatherers on the African savanna. Fervently rejecting “ anthropodenial, ” the notion that nonhuman life does not share characteristics with humans, Thomas instead shows that paramoecia can learn, plants can communicate, humans aren ’ t really as special as we think we are—and that it doesn ’ t take a scientist to marvel at the smallest inhabitants of the natural world and their connections to all living things. A unique voice on anthropology and animal behavior, Thomas challenges scientific convention and the jargon that prevents us all from understanding all living things better. This joyfully written book is a fascinating look at the challenges and behaviors shared by creatures from bacteria to larvae to parasitic fungi, a potted hyacinth to the author herself, and all those in between.

Love, Grief, and Compassion—Surprising Observations of a Hidden World

In The Hidden Life of Trees, Peter Wohlleben shares his deep love of woods and forests and explains the amazing processes of life, death, and regeneration he has observed in the woodland and the amazing scientific processes behind the wonders of which we are blissfully unaware. Much like human families, tree parents live together with their children, communicate with them, and support them as they grow, sharing nutrients with those who are sick or struggling and creating an ecosystem that mitigates the impact of extremes of heat and cold for the whole group. As a result of such interactions, trees in a family or community are protected and can live to be very old. In contrast, solitary trees, like street kids, have a tough time of it and in most cases die much earlier than those in a group. Drawing on groundbreaking new discoveries, Wohlleben presents the science behind the secret and previously unknown life of trees and their communication abilities; he describes how these discoveries have informed his own practices in the forest around him. As he says, a happy forest is a healthy forest, and he believes that eco-friendly practices not only are economically sustainable but also benefit the health of our planet and the mental and physical health of all who live on Earth.

The next book in The Secret Life of... series, The Secret Life of Viruses offers an engaging introduction to the science behind viruses, how they spread, and how our bodies fight them. Young readers will learn about what viruses are, how they reproduce and spread, how our bodies fight them, the history of viruses in the world and more. By teaching readers about the science behind this timely topic and offering context for practices like social distancing and mask-wearing, this book will help ease fears kids may have about the subject and empower them to take steps to keep themselves and others healthy!

Elegant, suggestive, and clarifying, Lewis Thomas's profoundly humane vision explores the world around us and examines the complex interdependence of all things. Extending beyond the usual limitations of biological science and into a vast and wondrous world of hidden relationships, this provocative book explores in personal, poetic essays to topics such as computers, germs, language, music, death, insects, and medicine. Lewis Thomas writes, "Once you have become permanently startled, as I am, by the realization that we are a social species, you tend to keep an eye out for the pieces of evidence that this is, by and large, good for us."

"I will share my experiences of science— such as they are and as frankly as I can." With these words Professor Stephen Curry started writing about science on his blog in 2008. His aim was to identify the busyness of being a scientist working in the UK in the 21st century but the journey turned out to be much more interesting than he had ever imagined. This book contains a personal collection of his most interesting and significant blog posts. It is probably too long.

Your cells are talking about you. Right now, both your inner and outer worlds are abuzz; with chatter among living cells of every possible kind—from those in your body and brain to those in the environment around you. From electrical alerts to chemical codes, the greatest secret of modern biology, hiding in plain sight, is that all of life's activity boils down to one thing: conversation. While cells are commonly considered the building block of living things, it is actually the communication between cells that brings us to life, controlling our bodies and brains, determining whether we are healthy or sick, and directly influencing how we think, feel, and behave. In The Secret Language of Cells, doctor and neuroscientist Jon Liefj lets us listen in on these conversations, and reveals their significance for everything from mental health to cancer. He explains the surprising science of how very different cells—bacteria and brain cells, blood cells and viruses—all speak the same language. This overarching principle has been long overlooked because scientific journals use impenetrable jargon that makes it hard to be understood across disciplines, much less by the general public. Liefj presents a fascinating and accessible look into cellular communication science—a groundbreaking and comprehensive exploration of this biological phenomenon. In these pages, discover the intriguing lives of cells as they ask questions, get answers, give feedback, gather information, call for each other, and make complex decisions. During infections, immune T-cells tell brain cells that we should "feel sick" and lie down. Cancer cells warn their community about immune and microbe attacks. Gut cells talk with microbes to determine which are friends and which are enemies, and microbes talk with each other and with much more complicated human cells in ways that determine which medicines work and which will fail. With applications for immunity, chronic pain, weight loss, depression, cancer treatment, and virtually every aspect of health and biology, cellular communication is revolutionizing our understanding not just of disease, but of life itself. The Secret Language of Cells is required reading for anyone interested in following the conversation.

Acclaimed biologist Lewis Wolpert eloquently narrates the basics of human life through the lens of its smallest component: the cell. Everything about our existence—movement and memory, imagination and reproduction, birth, and ultimately death—is governed by our cells. They are the basis of all life in the universe, from bacteria to the most complex animals. In the tradition of the classic Lives of a Cell, but with the benefit of the latest research, Lewis Wolpert demonstrates how human life grows from a single cell into a body, an incredibly complex society of billions of cells. Wolpert goes on to examine the science behind topics that are much discussed but rarely understood—stem-cell research, cloning, DNA, cancer—and explains how all life on earth evolved from just one cell. Lively and passionate, this is an accessible guide to understanding the human body and life itself.

A pioneering and fascinating account of Arctic life—its secret history and dire future Barely inhabited, the Arctic is an alien world to most of us. It also holds critical clues about the future of our planet. In The Hidden Life of Ice, Marco Tedesco invites us to Greenland, where he and his fellow scientists are doggedly researching the dramatic changes afoot. Following the arc of his typical day at work, Tedesco unearths the secrets in the ice—from evidence of long-extinct "polar camels" to the fantastically weird microorganisms living at freezing temperatures in cryoconite holes. Tedesco weaves together the bald facts on climate change with poetic reflections on this endangered landscape, the epic deeds of great Arctic explorers, and the legends of the rare local populations. The Hidden Life of Ice is more than a diatribe on climate—it's a moving tribute to a beautiful place that may be gone too soon.

God doesn't bless us to raise our standard of living. God blesses us to raise our standard of giving, and that's where true joy is found. The New York Times bestselling author of Chase the Lion challenges us not to settle for half of what God offers when it comes to blessings—we are BLESSED to BLESS. His discovery started with a simple experiment. Whenever Batterson received a blessing, he would give a similar blessing away. If someone paid him a compliment or gave him a gift or went out of their way to help him, he would return the favor by doing something similar for someone else. We flip the blessing by blessing others in the way God has blessed us. That's how the blessing becomes a double blessing. It turns giving into a game—one we can't win because God will always outgive us! It's an ancient truth found within the Abrahamic covenant: "I will bless you . . . and you will be a blessing." In other words, we are blessed to bless. The first blessing is receiving, but it doesn't end there. The second blessing is giving it away! That's the double blessing. And that's where double joy is found. In a day and age where the idea of blessing has been reduced to a hashtag (#blessed), Batterson challenges readers to pursue true, God-glorifying blessing and experience an exponential impact by participating in the double blessing. Don't settle for half of what God offers. Discover how you can both get it and give it . . . in Double Blessing.

In any given year, millions of people visit one or more of the 154 national forests in the United States, not to mention the hundreds of thousands who spend some time in the private forests of the nation. All of them - hikers, hunters, fishermen, campers, and canoeists - are drawn to the woods for some special reason. Yet few of them see the forest as a whole, as the web of life it truly is. Here, from New York Times bestselling author Richard M. Ketchum, is the extraordinary story of forests and the trees that comprise them.

The shift from traditional documentary to “factual entertainment” television has been the subject of much debate and criticism, particularly with regard to the representation of science. New types of factual programming that combine documentary techniques with those of entertainment formats (such as drama, game-shows and reality TV) have come in for strident criticism. Often featuring spectacular visual effects produced by Computer Generated Imagery these programmes blur the boundaries between mainstream science and popular beliefs. Through close analysis of programmes across a range of sciences, this book explores these issues to see if criticisms of such hybrid programmes as representing the “rotting carcass of science TV” really are valid. Campbell considers if in fact; when considered in relation to the principles, practices and communication strategies of different sciences; these shows can be seen to offer more complex and rich representations that construct sciences as objects of wonder, awe and the sublime.

Nonfiction is widely read and is increasingly prominent in the curriculum.

In the tradition of the classic “Lives of a Cell,” but with the benefit of the latest research, an internationally acclaimed embryologist demonstrates how human life derives from a single cell and then grows into a body, an incredibly complex society made up of billions of them.

“A beautifully written journey into the mechanics of the world of the cell, and even beyond, exploring the analogy with computers in a surprising way” (Denis Noble, author of Dance to the Tune of Life). How does a single-cell creature, such as an amoeba, lead such a sophisticated life? How does it hunt living prey, respond to lights, sounds, and smells, and display complex sequences of movements without the benefit of a nervous system? This book offers a startling and original answer. In clear, jargon-free language, Dennis Bray taps the findings from the discipline of systems biology to show that the internal chemistry of living cells is a form of computation. Cells are built out of molecular circuits that perform logical operations, as electronic devices do, but with unique properties. Bray argues that the computational juice of cells provides the basis for all distinctive properties of living systems: it allows organisms to embody in their internal structure an image of the world, and this accounts for their adaptability, responsiveness, and intelligence. In Wetware, Bray offers imaginative, wide-ranging, and perceptive critiques of robotics and complexity theory, as well as many entertaining and telling anecdotes. For the general reader, the practicing scientist, and all others with an interest in the nature of life, this book is an exciting portal to some of biology’s latest discoveries and ideas. “Drawing on the similarities between Pac-Man and an amoeba and efforts to model the human brain, this absorbing read shows that biologists and engineers have a lot to learn from working together.” —Discover magazine “Wetware will get the reader thinking.” —Science magazine

A vocation is an extremely mysterious reality. The call of God is not something extrinsic; it penetrates to the most intimate centre of the heart. We are not what we are on account of this call. The Call of Silent Love is a profound and eloquent examination of the twin themes of vocation and discernment in which the father-master speaks about the nature of a calling, and the internal and external struggles, the discernment of spirits and the overall framework in which we live our lives. The reader is faced with a rare and compelling account of Carthusian spirituality that is simple, sustaining and inviting - to every Christian.' She was a poor Southern tobacco farmer who worked the same land as her slave ancestors, yet her cells—taken without her knowledge—became one of the most important tools in medicine. The first “immortal” human cells grown in culture, which are still alive today, though she has been dead for more than sixty years. HeLa cells were vital for developing the polio vaccine; uncovering secrets of cancer, viruses, and the atom bomb’s effects; helped lead to important advances like in vitro fertilization, cloning, and gene mapping; and have been bought and sold by the billions. Yet Henrietta Lacks remains virtually unknown, buried in an unmarked grave. Henrietta’s family did not learn of her “immortality” until more than twenty years after her death, when scientists investigating HeLa began using her husband and children in research without informed consent. And though the cells had launched a multimillion-dollar industry that sells human biological materials, her family never saw any of the profits. As Rebecca Skloos so brilliantly shows, the story of the Lacks family—past and present—is inextricably connected to the dark history of experimentation on African Americans, the birth of biotechis, and the legal battles over whether we control the stuff we are made of. Over the decade it took to uncover this story, Rebecca became enmeshed in the lives of the Lacks family—especially Henrietta’s daughter Deborah. Deborah was consumed with questions: Had scientists cloned her mother? Had they killed her to harvest her cells? And if her mother was so important to medicine, why couldn’t her children afford health insurance? Intimate in feeling, astonishing in scope, and impossible to put down, The Immortal Life of Henrietta Lacks captures the beauty and drama of scientific discovery, as well as its human consequences.

Historically, atheism has always been lame and puerile, but this new kid in the block called militant atheism uses science and evolution as its twin crutches and, by doing so, pretends to have rational and scientific basis for their worldview. This is done to the extent that all their books and websites are more about science and its methodology or its progress rather than about atheism itself. Their strident smart talk and rational pretensions has a following whose numbers are unfortunately increasing. Aided by vitriolic books and debates of Richard Dawkins, Daniel Dennett, and Sam Harris, they are becoming more vocal by the day. This book uses a radically new approach in Christian apologetics by critically examining their arguments and going on the offensive to expose their scientific and rational pretensions. And by doing that, we can clearly see the poverty of their worldview!
