This unique work from acclaimed author Dr. Paul Marino (Marino's The ICU Book, The Little ICU Book) challenges the traditional notion that the human body thrives on oxygen, and that promoting tissue oxygenation is necessary for promoting life. This concept fails to recognize that oxygen is a destructive molecule that also damages the human body. Instead of welcoming oxygen, the human body limits exposure of the tissues to oxygen, and employs an army of chemical antioxidants to combat the damaging effects of oxygen. This "oxygen protective" human design represents a new paradigm for the relationship between oxygen and human survival, and it has important implications for the excessive and unregulated use of oxygen in clinical practice.

***Extracorporeal Membrane Oxygenation (ECMO) is a procedure that uses a machine to take over the work of the lungs and sometimes the heart. The system provides heart-lung bypass support using a pump to circulate blood through an artificial lung back into the bloodstream, providing enough oxygen to the patient, whilst allowing time for the lungs and heart to rest or heal during or after serious illness. ECMO is often used for babies, but can also be used for children and adults (Medline Plus). The techniques for ECMO require professionals from multidisciplinary background to be involved in the procedure. This practical manual is a comprehensive guide to ECMO. Divided into eleven sections, the book begins with an introduction to the procedure and equipment. The following sections provide step by step discussion on initiation, maintenance of support and monitoring, and techniques of ECMO for different case scenarios. The final sections present multiple choice questions for self assessment and extensive appendices. *This book describes the pathophysiological significance of the hemodynamic monitoring parameters available to the clinician and their role in providing reliable and reproducible information on the cardiocirculatory status of a patient in shock. It is explained how measurements of these parameters enable the intensivist to understand the patient's condition and to make more informed treatment decisions in order to optimize the hemodynamic status and improve the prognosis. Full guidance is provided on measurement of intravascular blood pressures, cardiac output, and derived variables. Methods of cardiac output determination based on the classical pulmonary thermodilution, transpulmonary thermodilution, echocardiography, and Doppler techniques are reviewed. Techniques based on calibrated and non-calibrated pulse contour analysis are discussed,*

*with attention to their limitations. Furthermore, the dynamic indices of fluid responsiveness, their clinical applications, and issues related to their use are addressed. Care is also taken to explain the physiological concepts underlying various devices used by anesthesiologists and intensivists.*

*The current practice of medicine is largely moving toward applying an evidence-based approach. Evidence-based medicine is the integration of best research evidence using systematic reviews of the medical literature and then translating it into practice by selecting treatment options for specific cases based on the best research. Clinicians rely on the availability of evidence and accordingly take decisions to provide best treatment to their patients. Clinical management of neurologically compromised patients is challenging and varied; for this reason, treating physicians including neuroanesthesiologists are always in search of best available evidence for patient management and care. Essentials of Evidence-Based Practice of Neuroanesthesia and Neurocritical Care highlights the various controversies that exist in the practice of neuroanesthesia and provides conclusive evidence-based solutions. This comprehensive resource succinctly discusses evidence-based practice of neuroanesthesia based on systematic reviews in clinical neuroscience research. Topics include neurophysiology: ICP or CPP thresholds; neuropharmacology: intravenous or inhalational anesthetics; and neuromonitoring: ICP monitoring. Evidence-based practice is now an integral part of neuroscience, and this book will help residents and trainees gain knowledge to apply it to their practice. • Highlights the various controversies that exist in the practice of neuroanesthesia and provides conclusive evidence-based solutions • Topics include neurophysiology: ICP or CPP thresholds; neuropharmacology: intravenous or inhalational anesthetics; and neuromonitoring: ICP monitoring • Provides residents and trainees with the knowledge to apply evidence-based practice of neuroanesthesia to their practice The authoritative, evidence-based coverage you need to safely and competently care for adult, critically ill patients and their families – or prepare for the critical care nursing certification exam Endorsed by the American Association of Critical-Care Nurses and written by top clinical experts in acute care nursing, this textbook thoroughly*

*covers all the need-to-know details on the care of adult, critically ill patients and their families. Supported by helpful tables and algorithms, the book's practical, building-block organization starts with the basics before proceeding to more complex concepts, paralleling the blueprint for the critical care nursing CCRN certification examination. AACN Essentials of Critical Care Nursing is divided into four logical sections, which, taken as a whole, will give you complete understanding of this challenging area of nursing practice: The Essentials – provides fundamental information that new clinicians must understand to provide safe, competent nursing care to all critically ill patients, regardless of their underlying medical diagnosis. Pathological Conditions – covers pathologic conditions and management strategies commonly encountered in all adult critical care units.
