as being beyond human control. Efforts to prevent road traffic injuries are hampered by a lack of human capacity. Policy-makers, researchers and practitioners need information on effective prevention measure and on how to develop, implement and evaluate such interventions. There is a need to train more specialists in road traffic injury prevention in order to address the growing problem of road traffic injuries at international levels.

Severe forms of the disease that develop in the early childhood should be identified. These are caused by anomalies of the vertebrae and structural defects of the thorax. If left untreated, they may cause a significant reduction in lung volume , functional disturbance of the spinal cord and the development of a severe malposition. A suspicion of scoliosis in a child less than 5 years of age is always an indication to refer the child to specialized care for investigations. For many years, the operative manipulation of the most minute structures was frustrated by the limitations of the human eye. With the introduction of the operating microscope by Nysten (1921), fine detailed anatomy was made visible, so that structures could be prepared, presented and manipulated. Nysten used the microscope for treating diseases of the middle ear. In 1946 Perritt in the U. S. A. introduced the operating microscope into the field of ophthalmic surgery. In 1964, Smith, Kunze and Mitchen published reports on their clinical experience using the operating microscope in nerve surgery. Using this technique, it was possible to divide a peripheral nerve into individual fascicle bundles and repair each bundle precisely. Following on from these developments, the term "

microsurgery" was introduced to cover that branch of surgery which was carried out using the "equipped" eye - either by using 10x spectacle magnification or, more commonly, the operating microscope. The term "microvascular surgery" developed for the operative treatment of small vessels below 2 mm in diameter. Experimental studies for the use of microsurgery in the clinical situation developed alongside its use on small research animals for transplantation models in immunological study. Microsurgical techniques were used in the transplantation of rat liver, kidneys, pancreas, heart and other organs. The clinical application of these microsurgical techniques is nowadays called "reconstructive microvascular surgery".

In general, surgeons strive to achieve excellent results and ideal patient outcomes, however, this noble task is frequently failed. For patients, surgical complications are analogous to “friendly fire” in wartime. Both scenarios imply that harm is unintentionally done by somebody whose aim was to help. Interestingly, adverse events resulting from surgical interventions are more frequently related to system errors and a communication breakdown among providers, rather than to the imminent threat of the surgical blade “gone wrong”. primary lesion, however, lies in the median sagittal plane taking the form of a lordosis. Although the clinical manifestations of scoliosis have been well documented, cause and pathogenesis have not yet been determined. Research into what causes IS has focused on the structural elements of the spine, spinal musculature, collagenous structures, the endocrine system, the central nervous system, and genetics. Results of these studies have brought about a new perception of IS as an epiphenomenon, but the main cause of IS remains unknown. During that summer Tris "lent" me to Chester Bums, who has done important scholarly work over the years on the history of medical ethics. I was just finding out what bioethics was and Chester sent me to the rare book room of the Medical Branch Library to do some work on something called "medical deontology. " I discovered that this new field of bioethics had a history. This string of accidents continued, in 1975, when Warren Reich (who in 1979 made the excellent decisions to hire me to the faculty in bioethics at the Georgetown

University School of Medicine and to persuade Andre Hellegers to appoint me to the Kennedy Institute of Ethics) took Tris Engelhardt's word for it that I could write on the history of modern medical ethics for Warren's major new project, the Encyclopedia of Bioethics. Warren then asked me to write on eighteenth-century British medical ethics.

This work examines the imagery and symbolism which surrounded the body in the Middle Ages. The author focuses on the King's surgeon in 14th century France,

Henri de Mondeville, one of the first doctors to defy openly the authority of the Church by performing dissection on the human body. At a time when surgery was still associated both with manual labour and the mysteries of ritual, Mondeville sought to liberate the body from its metaphysical associations and place its study firmly in the realm of science. Through a close and scholarly examination of Mondeville's language, Pouchelle traces the complex imagery which depicted the body and its functions, including digestions, pregnancy

and illness. Pouchelle describes the ambivalent attitudes towards surgeons, as men who were both mystical and holy but also unclean because of their contact with blood. The author focuses on dissection, a process which had to be veiled in ritual in order to circumvent the taboo of opening a corpse. She shows how the 14th century world view, which saw the body as a microcosm of its surroundings, still has resonances in the language of the 20th century. This is a study of the workings of language and the imagination in relation to
