problems in engineering. An introduction to MATLAB basics is presented along with MATLAB commands. MATLAB is considered as the software of choice. MATLAB can be used interactively and has an inventory of routines, called as functions, which minimize the task of programming even more. In the computational aspects, MATLAB has emerged as a very powerful tool for numerical computations involved in engineering

topics. The idea of computer-aided design and analysis using MATLAB with the Symbolic Math Tool box and the control systems tool box has been incorporated. Many solved problems are presented that demonstrate the application of MATLAB to the analysis of problems in control systems, basic engineering mechanics: statics and dynamics, mechanical vibrations, electrical circuits, and numerical methods.

Presentations are limited to very basic topics to serve as an introduction to advanced topics in those areas of discipline. The numerous worked examples and unsolved exercise problems are intended to provide the reader with an awareness of the general applicability of MATLAB. An extensive bibliography to guide the student to further sources of information on engineering topics covered in this book using MATLAB is

integration, the Gauss elimination method for solving systems of linear algebraic equations, the Runge-Kutta method for solving ordinary differential equations, and the search method in combination with the bisection method for obtaining the roots of transcendental and polynomial equations. It also highlights MATLAB's built-in functions. These include interp1 function, the quad and dblquad functions, the inv function, the ode45 function, the fzero function, and many others. The second half of the text covers more advanced topics, including the iteration method for solving pipe flow problems, the Hardy-Cross method for solving flow rates in a pipe network, separation of variables for solving partial differential equations,
