The increasing use of cytology in clinical practice and advances in techniques and diagnostic interpretation justify the devotion of more space than formerly to this important topic. Immunohistology now merits a separate chapter because it

has a status beyond that of being just another "special stain" and there are certain aspects of technique and interpretation that are peculiar to it. Quality control and assessment in histopathology are very topical and important now that greater attention is being paid to cost effectiveness and the auditing of many aspects of clinical practice. The autopsy is an integral part of the professional life of a histopathologist and, though it lacks the immediate clinical impact of the biopsy diagnosis, it nevertheless constitutes an important activity in all hospitals; without detailing dissection techniques I have provided some information and guidance about the autopsy which I believe will be useful to trainees and of interest to others.

The remainder of the book has been thoroughly revised and updated, and illustrations and tables added where experience has shown that the text is insufficient. Sheffield, October 1986 J. C. E. Underwood Preface to the First Edition This book is primarily addressed to the needs of the trainee histopathologist.

Non-pathologists, such as toxicologists and study personnel, can find it difficult to understand the data they receive from pathologists.

Toxicological pathologists write long, detailed and highly technical reports. Study personnel are under daily pressure to decide whether lesions described in pathology reports are treatment-related and thus important to the pharmaceutical company or

whether the lesions are background changes and thus of little significance. Written by experienced toxicological pathologists, *Pathology for Toxicologists: Principles and Practices of Laboratory Animal Pathology for Study Personnel* serves to bridge the gap in the understanding of pathology data, enabling non-pathologists to more easily comprehend pathology reports, better integrate pathology data into final study reports and ask pathologists relevant questions about the test compound. This succinct, fully referenced, full colour book is suitable for toxicologists at all stages of their training or career who want to know more about the pathology encountered in laboratory animals used in safety studies. Key features include important
