**As environmental challenges grow larger in scale and implications, it is increasingly important to apply the best scientific knowledge in the decisionmaking process. Editors Farrell and Jger present environmental assessments as the bridge between the expert knowledge of scientists and engineers on the one hand and decisionmakers on the other. When done**

**well, assessments have a positive impact on public policy, the strategic decisions of private firms, and, ultimately, the quality of life for many people. This book is the result of an international, interdisciplinary research project to analyze past environmental assessments and understand how their design influenced their effectiveness in bringing scientific evidence and insight into the decisionmaking process. The case studies in the book feature a wide range of regional and global risks, including ozone depletion, transboundary air**

**pollution, and climate change. Assessments of Regional and Global Environmental Risks offers several important contributions. It provides a clear account of the choices faced in the design of environmental assessments and a clear description of the lessons learned from past assessments. It illustrates why assessments are social processes, not simply reports. And, while they identify no universal, one-size-fits-all design, the authors find that, to be effective, environmental assessments must be viewed by those who produce and use them as being**

**salient; credible in their scientific support; and legitimate, or fair in design and execution.**

**Effective policies to prevent global warming and climatic change are urgently required by the world community. However, international negotiations on this issue repeatedly come up against the problems of allocating responsibility for the greenhouse effect, and bearing the costs of remedying the situation.;This volume offers a multidisciplinary response to the challenge. It presents the scientific, economic and**

**political issues and goes on to describe the policy options available. The different ways of determining responsibility for greenhouse gases and calculating obligations to pay for hazards to the environment are analyzed. The contributors examine the implications for various countries, while a concluding chapter explores climatic change negotiations - what is at stake, and for whom.**

**This Intergovernmental Panel on Climate Change Special Report (IPCC-SREX) explores the challenge of understanding and**

**managing the risks of climate extremes to advance climate change adaptation. Extreme weather and climate events, interacting with exposed and vulnerable human and natural systems, can lead to disasters. Changes in the frequency and severity of the physical events affect disaster risk, but so do the spatially diverse and temporally dynamic patterns of exposure and vulnerability. Some types of extreme weather and climate events have increased in frequency or magnitude, but populations and assets at risk have also increased, with consequences for disaster**

**risk. Opportunities for managing risks of weather- and climate-related disasters exist or can be developed at any scale, local to international. Prepared following strict IPCC procedures, SREX is an invaluable assessment for anyone interested in climate extremes, environmental disasters and adaptation to climate change, including policymakers, the private sector and academic researchers.**

Based on case studies in Southern Africa, West Africa and East Africa, this book revisits some of the dilemmas and paradoxes associated with the development, management and utilisation of environmental resources, as well as lacklustre official handling of climate change-related challenges, in Sub-Saharan Africa. On the subject of natural resource exploitation, in particular, the book revisits scholarly debates and specific practices around compensation, benefit- and burden-sharing, local participation and space-place dynamics. It highlights fundamental ambiguities in the ways the dominant

discourses and policy responses have been framed and mobilised, and examines epistemic and ideational incongruences that have hobbled and sometimes negated the effectiveness of otherwise well-intentioned interventions. On climate change, the book revisits debates around the vulnerability-assets nexus with regard to mitigation and adaptation, as well as the intersection of climate information and livelihoods in agro-based settings. The contradictions, gaps and limitations of climate change policies and strategies in different regions are re-examined based on new data. In the last few years, the Environment and Natural Resources Working Group of the South African Sociological Association (SASA) has intensified

efforts to go beyond the annual SASA Congresses and the production of journal articles, in making the research agendas of its members more visible to the global scholarly and policy community. This book is one result of such efforts. It calls for a constant questioning of orthodoxies and the promotion of ethnographically sensitive and epistemologically nuanced scholarly and policy approaches to developmental challenges in Africa, especially in relation to environmental resources and environmental change. The Intergovernmental Panel on Climate Change (IPCC) was set up jointly by UNEP and the World Meteorological Organisation in 1988 to provide periodic scientific analysis of the causes, impacts and possible policy response options

to climate change issues. This synthesis report is the 4th and final part of the IPCC's third assessment report, and contains information on nine policy-relevant questions regarding the IPCC's 2001 assessment. It is intended to assist governments, individually and collectively, to formulate appropriate adaptation and mitigation responses to the threat of human-induced climate change. The debate on the valuation of nature and the environment, sustainable national income and economic growth is one of prime importance in environmental economics. The main advantage of this book is that it gathers and presents extensive interdisciplinary expertise in the parameterization of global biogeochemical cycles and other environmental processes in the context of globalization and sustainable development. In this regard, the crucial global problems concerning the dynamics of the nature-society system are considered and the key problems of ensuring the system's sustainable development are studied. Economics and the Challenge of Global Warming is a balanced and comprehensive analysis of the role of economics in confronting global warming, the central environmental issue of the twenty-first century. It avoids a technical exposition in order to reach a wide audience and is up to date in its theoretical and empirical underpinnings. It is addressed to all who have some knowledge of economic concepts and a serious interest in how economics can (and cannot) help in crafting climate

policy. The book is organized around three central questions. First, can benefit-cost analysis guide us in setting warming targets? Second, what strategies and policies are cost-effective? Third, and most difficult, can a global agreement be forged between rich and poor, North and South? While economic concepts are foremost in the analysis, they are placed within an accessible ethical and political matrix. The book serves as a primer for the post-Kyoto era.

At a time of so much politicized debate over the phenomenon of global warming, the second edition of *The Future of the World's Climate* places the discussion in a broader geological, paleo-climatic, and astronomical context. This book is a resource based on reviews of current climate science and supported by sound, accurate data and projections made possible by technological advances in climate modeling. Crucially, this title examines in detail a wide variety of aspects, including human factors like land use, expanding urban climates, and governmental efforts at mitigation, such as the Kyoto Protocol. It also examines large-scale, long-
