disorder (ADHD), depression, and autism have devastating consequences on the lives of children and adolescents. Early assessment of their mental health problems is essential for preventative measures and intervention. This timely, authoritative guide will be of interest to everyone involved in child psychiatry. This is the inaugural volume of the new series: Critical Issues in Psychiatry: An Educational Series for Residents and Clinicians. It is an appropriate beginning, for this book represents a milestone in the evolution of psychiatric education. For the first time, there will now be a single place where one can find a comprehensive collection of educational goals and objectives to define the broad spectrum of knowledge and skills essential for general and child psychiatry. This collection does not represent the bias of

a single educator or program. Rather, it consists of a consensually validated ranking of relative importance for each educational goal and objective as determined by a large and international sampling of experienced psychiatric educators, as well as an editorial board with some of the most distinguished names in psychiatric education. It is even possible to tell at a glance whether the ranked level of importance is the same or different within several national groups, for example Canadians vs. Americans. This book is intended for all students of psychiatry. It is particularly valuable to residents in training, but equally so for experienced clinicians preparing for Board examination or simply attending to the process of continuing education and intellectual renewal. While it might well be used by an

The integration of animals into the therapy setting by psychotherapists has been a growing trend. Psychological problems treated include emotional and behavioral problems, attachment issues, trauma, and developmental disorders. An influential 1970s survey suggests that over 20 percent of therapists in the psychotherapy division of the American Psychological Association incorporated animals into their treatment in some fashion. Anecdotal evidence

suggests that the number is much higher today. Since Yeshiva University psychologist Boris Levinson popularized the involvement of animals in psychotherapy in the 1960s, Israel has come to be perhaps the most advanced country in the world in the area of animal-assisted psychotherapy (AAP). This is true especially in the areas of academic training programs, theory-building, and clinical practice. Great effort has been put into understanding the mechanisms behind AAP, as well as into developing ethical guidelines that take into account the therapist's

It emphasizes evidence-based and clinically sound applications with psychotherapeutic goals, as differentiated from other animal-assisted interventions, such as AAE (animal-assisted education) and AAA (animal-assisted activities), which may have education or skills-oriented goals. embrace the new technology of behavior change in the late 1950s and early 1960s, it is apparent that we have had the opportunity to learn a great deal.
