In Foundations of Ethical Practice, Research, and Teaching in Psychology and Counseling, Kitchener and Anderson lay a conceptual foundation for thinking well about ethical problems. Whereas the first edition focused mainly on ethical reasoning and decision making, this new edition draws more explicitly on all components of James Rest's model of moral/ethical behavior, including moral/ethical sensitivity, moral/ethical decision making, moral/ethical motivation, and the ego strength to follow through on the decision. The book addresses five key principles of ethical decision making and includes updated sections on research, teaching and supervision, and practice. It discusses the relationship of the ethical principles and the model of ethical decision-making to professional ethical codes, while offering discussion questions, case scenarios, and activities to help the reader focus on ethical character and virtue. Foundations of Ethical Practice, Research, and Teaching in Psychology and Counseling gives psychologists, students, and trainees the tools they need to analyze their own ethical quandaries and take the right action.

This Handbook represents the first concerted effort to understand male mental health in a way that facilitates a positive step forward in both theory and treatment. An alarming number of men experience serious mental health issues, as demonstrated by high rates of suicide and violent offending. Despite these problems, the study of male psychology has either been overlooked, or viewed as a problem of defective masculinity. This handbook brings together experts from across the world to discuss men’s mental health, from prenatal development, through childhood, adolescence, and fatherhood. Men and masculinity are explored from multiple perspectives including evolutionary, cross-cultural, cognitive, biological, developmental, and existential viewpoints, with a focus on practical suggestions and demonstrations of successful clinical work with men. Throughout, chapters question existing models of understanding and treating men’s mental health and explore new approaches, theories and interventions. This definitive handbook encapsulates a new wave of positive theory and practice in the field of male psychology and will be of great value to professionals, academics, and those working with males through the lifespan in any sector related to male mental health and wellbeing.

This two volume text provides a comprehensive introduction to the issues, theories and methods of psychology, including both classic approaches and recent research. The areas covered range from the intellectual, social and emotional development of the child to the ways in which adults perceive, attend, remember and communicate; from Freud's psychoanalytic framework to the work of present day psychologists; from debates about the scientific status of psychology to the special problems which the study of people poses for psychologists. Each chapter presents important issues in depth, highlighting controversies while showing that they rarely have neat solutions. Throughout, emphasis is given to the contrasting levels of analysis which contribute to the understanding of psychological functioning, from fundamental biological processes to complex social interactions. While prepared for the Open University course "Introduction to Psychology" these volumes will provide an excellent introduction to students of psychology at other universities and colleges. The text incorporates the best of the Open University's tried and tested teaching methods, and particular importance is placed on encouraging the reader's active participation, making the books enjoyable and stimulating as well as informative. The text is divided into eight sections comprising eighteen

The subject of thinking is the oldest in the whole science of psychology, going back to well before the separation of the disciplines of philosophy and psychology. Originally published in 1983, this collection of up-to-date critical essays about thinking – with particular emphasis on reasoning – is written from the perspective of psychologists who are themselves actively engaged in research into the nature of human thought. The editor's introduction identifies the major issues which have traditionally concerned students of human thought, and provides an historical background. It describes how at first the subject was studied by introspection, and how this method fell into disrepute at the end of last century. A satisfactory alternative has not yet emerged, although much recent work is based on the information-processing model, which sees the brain as a sophisticated computer. Consequently the papers presented in this volume deal with a wide range of issues, and a number of different experimental tasks and paradigms. They cover most current approaches to the theory and methodology of cognitive psychology, including problem solving, the relationship between language and thought, and reasoning.

This textbook offers a fresh approach to health psychology through the theory and practice of behaviour change. Using an array of case studies from around the world, it discusses how we can develop and evaluate behaviour change interventions. The book encourages active engagement with contemporary discussions about health behaviours, covering areas of emerging importance such as weight stigma, vaping, nudges, vaccine hesitancy and paleo-inspired lifestyles. With a focus upon critical thinking, this book will equip students for success in their research projects and beyond. Ideal for students of Health Behaviour Change and Health Psychology, this textbook is also relevant to those taking courses in related fields such as Nursing and Public Health.

This new volume provides an interdisciplinary perspective on how intersections of race, class, gender, sexuality, and culture shape the cultural psychology of immigrants. It demonstrates the influence transnational ties and cultural practices and beliefs play on creating the immigrant self. Distinguished scholars from a variety of fields examine the cultural psychological consequences of displacement among different immigrant communities. Cultural Psychology of Immigrants opens with a variety of theoretical perspectives on immigration and a historical overview of sociological research on immigrants. It then examines the racial discrimination of immigrants and the multifaceted influences on the creation of immigrant identities. The final section documents the pivotal role of family contexts in shaping identity. Each chapter illustrates the commonalities and differences among immigrants in the ways in which they make sense of their newfound selves in a displaced context. Intended for advanced students and researchers in the fields of psychology, social work, marriage and family therapy, public health, anthropology, sociology, education, and ethnic studies, the book also serves as a resource in courses on cultural psychology, immigrant studies, minority groups, race and ethnic relations, self and identity, culture and human development, and immigrants and mental health.

This book is based on a symposium that was inspired by the late Donald O. Hebb who, in his latter years while an Honorary Professor in the Department of Psychology at Dalhousie University, became very interested in the phenomenon of multiple personality and other dissociative states. Hebb was troubled by the lack of understanding of dissociative behavior and, through his discussions with basic science and clinical colleagues in psychology and psychiatry, he became convinced that the subject would be a figurative gold mine for psychological theory and experimentation. The purpose of the symposium was to bring together clinical and research scientists with an interest and expertise in dissociative phenomena such as multiple personality disorder, hysteria and hypnosis. This group would exchange ideas and findings, discuss theory, and lay the groundwork for an interdisciplinary research program into dissociative phenomena generally, and more specifically into multiple personality disorder and its principal precipitating factor -- physical and sexual abuse in children.

"This volume is the outgrowth of the proceedings of the ninth annual Institute for Research in Clinical Psychology ... held at the University of Kansas campus on April 3rd to 5th, 1967. Their focus has been on new developments in research and theory in clinical psychology.

It creates a detailed example of a psychology degree using the PBL method and suggests how a week of the course could be planned.

Most clinical psychologists and cognitive behaviour therapists adopt a perspective which assumes that a client's distress arises from inaccurate perceptions of the external world and that these perceptions are due to the problematic filtering of information about the external world through internal perceptual biases and schemas. A Constructionist Clinical Psychology for Cognitive Behavioural Therapy provides a timely and innovative critique of the dominant trends in CBT theory and practice. It applies a constructionist framework to treatment and offers a constructionist philosophy and methodology to complement existing clinical approaches in cognitive behaviour therapy. Kieron O'Connor presents a much needed alternative constructionist framework (addressing both individual and social constructionist ideas) which is laid out in a clear fashion for the clinician. He shows how the framework can be integrated into practice and offers an alternative to viewing psychopathology as an isolated problem which focuses on pathology as a response to internal or external events. He reveals how the new constructionist framework can encourage clinicians to look at the client centred context which creates psychopathology and explore areas and experiences not easily accessible to traditional cognitive behaviour approaches, but which are rendered understandable through a constructionist approach to experience. Using extensive case studies, A Constructionist Clinical Psychology for Cognitive Behavioural Therapy provides a constructionist framework approach which complements existing CBT approaches and shines new light on questions as to why some techniques work and others do not. With new tools for case formulation and evaluation, and trainee exercises for beginners, the book will appeal to clinical psychologists, clinical researchers, psychotherapists and other health and mental health professionals
