"Lab Manual for Biomedical Engineering: Devices and Systems" examines key concepts in biomedical systems and signals in a laboratory setting. Designed for lab courses that accompany lecture classes using "Systems and Signals for Bioengineers" by J. Semmlow, the book gives students the opportunity to complete both measurement and math modeling exercises, thus demonstrating that the experimental real world setting directly corresponds with classroom theory. In completing the lab work, students enhance their understanding of the lecture course. They connect theory to real data, which helps them master the scientific method. All the experiments in the lab manual have been extensively class-tested over several years. Sample measurements are provided for each experiment, ensuring that students are seeing correct results. All exercises include a set of lab report questions tied to the concept taught in the corresponding lecture course. Each experiment builds on knowledge acquired in previous experiments, allowing the level of difficulty to increase at an appropriate pace. Concepts covered in the manual include: Wave MathFourier TransformationNoise VariabilityTime Signals and FrequencySystems Modeling "Lab Manual for Biomedical Engineering: Devices and Systems" effectively supports the recommended required text, and has been shown to improve student comprehension and retention. The manual can be used in undergraduate courses for biomedical engineering students who have completed introductory Electrical and Mechanical Physics courses. A two-semester background in Calculus is also recommended. Gary M. Drzewiecki earned both his M.S. in Electrical Engineering and his Ph.D. in Bioengineering at the University of Pennsylvania. History of Programming Languages presents information pertinent to the technical aspects of the language design and creation. This book provides an understanding of the processes of language design as related to the environment in which languages are developed and the knowledge base available to the originators. Organized into 14 sections encompassing 77 chapters, this book begins with an overview of the programming techniques to use to help the system produce efficient programs. This text then discusses how to use parentheses to help the system identify identical subexpressions within an expression and thereby eliminate their duplicate calculation.

Other chapters consider FORTRAN programming techniques needed to produce optimum object programs. This book discusses as well the developments leading to ALGOL 60. The final chapter presents the biography of Adin D.

Falkoff. This book is a valuable resource for graduate students, practitioners, historians, statisticians, mathematicians, programmers, as well as computer scientists and specialists.

This is the first book-length study of bilingual, international, and immigrant students in English writing courses that attempts to fully embed their writing experiences within the broader frame of their personal histories, the human context of their development, and the disciplinary contexts of their majors. It addresses the questions: How useful are L2 writing courses for the students who are required to take them? What do the students carry with them from these courses to their other disciplinary courses across the curriculum? What happens to these students after they leave ESL, English, or writing classes? Drawing on data from a 5-year longitudinal study of four university students for whom English was not their strongest/primary language, it captures their literacy experiences throughout their undergraduate careers. The intensive case studies answer some questions and raise others about these students' academic development as it entwined with their social experiences and identity formation and with the ideological context of studying at a US university in the 1990s.
