EBONY is the flagship magazine of Johnson Publishing. Founded in 1945 by John H. Johnson, it still maintains the highest global circulation of any African American-focused magazine.

From the celebrated author of the best-selling Physics for Future Presidents comes "a provocative, strongly argued book on the fundamental nature of time" (Lee Smolin). You are reading the word "now" right now. But what does that mean? "Now" has bedeviled philosophers, priests, and modern-day physicists from Augustine to Einstein and beyond. In Now, eminent physicist Richard A. Muller takes up the challenge. He begins with remarkably clear explanations of relativity, entropy, entanglement, the Big Bang, and more, setting the stage for his own revolutionary theory of time, one that makes testable predictions. Muller's monumental work will spark major debate about the most fundamental assumptions of our universe, and may crack one of physics' longest-standing enigmas.

Personality Capture and Emulation is the gateway to an amazing future that actually may be achieved, enabling the preservation and simulation of human personalities at progressively higher levels of fidelity. This challenge is no longer the province merely of uninhibited visionaries, but has become a solid field of research, drawing upon a wide range of information technologies in human-centered computing and cyber-human systems. Even at modest levels of accomplishment, research in this emerging area requires convergence of cognitive, social, and cultural sciences, in cooperation with information engineering and artificial intelligence, thus stimulating new multidisciplinary perspectives. Therefore this book will inspire many specific research and development projects that will produce their own valuable outcomes, even as the totality of the work moves us closer to a major revolution in human life. Will it ever really be possible to transfer a human personality at death to a technology that permits continued life? Or will people come to see themselves as elements in a larger socio-cultural system, for which a societal information system can provide collective immortality even after the demise of individuals? A large number and variety of pilot studies and programming projects are offered as prototypes for research that innovators in many fields may exploit for the achievement of their own goals. Together, they provide an empirical basis to strengthen the intellectual quality of several current debates at the frontiers of the human and information sciences.

The Perfect Score Project is an indispensable guide to acing the SAT – as well as the affecting story of a single mom ’ s quest to light a fire under her teenage son. It all began as an attempt by Debbie Stier to help her high-school age son, Ethan, who would shortly be studying for the SAT. Aware that Ethan was a typical teenager (i.e., completely uninterested in any test) and that a mind-boggling menu of test-prep options existed, she decided – on his behalf -- to sample as many as she could to create the perfect SAT test-prep recipe. Debbie ’ s quest turned out to be an exercise in both hilarity and heartbreak as she took the SAT seven times in one year and in-between “ went to school ” on standardized testing. Here, she reveals why the SAT has become so important, the cottage industries it has spawned, what really works in preparing for the test and what is a waste of time. Both a toolbox of fresh tips and an amusing snapshot of parental love and wisdom colliding with teenage apathy, The Perfect Score Project rivets. In the book Debbie does it all: wrestles with Kaplan and Princeton Review, enrolls in Kumon, navigates khanacademy.org, meets regularly with a premier grammar coach, takes a battery of intelligence tests, and even cadges free lessons from the world ’ s most prestigious (and expensive) test prep company. Along the way she answers the questions that plague every test-prep rookie, including: “ When do I start? ” ... ” Do the brand-name test prep services really deliver? ” ... ” Which should I go with: a tutor, an SAT class, or self study? ” ... ” Does test location really matter? ” ... “ How do I find the right tutor? ” ... “ How do SAT scores affect merit aid? ” ... and “ What ’ s the one thing I need to know? ” The Perfect Score Project ’ s combination of charm, authority, and unexpected poignancy makes it one of the most compulsively readable guides to SAT test prep ever – and a book that will make you think hard about what really matters.

Self-Scoring IQ Tests

Over the last few decades, economists and psychologists have quietly documented the many ways in which a person's IQ matters. But, research suggests that a nation's IQ matters so much more. As Garrett Jones argues in Hive Mind, modest differences in national IQ can explain most cross-country inequalities. Whereas IQ scores do a moderately good job of predicting individual wages, information processing power, and brain size, a country's average score is a much stronger bellwether of its overall prosperity. Drawing on an expansive array of research from psychology, economics, management, and political science, Jones argues that intelligence and cognitive skill are significantly more important on a national level than on an individual one because they have "positive spillovers." On average, people who do better on standardized tests are more patient, more cooperative, and have better memories. As a result, these qualities—and others necessary to take on the complexity of a modern economy—become more prevalent in a society as national test scores rise. What's more, when we are surrounded by slightly more patient, informed, and cooperative neighbors we take on these qualities a bit more ourselves. In other words, the worker bees in every nation create a "hive mind" with a power all its own. Once the hive is established, each individual has only a tiny impact on his or her own life. Jones makes the case that, through better nutrition and schooling, we can raise IQ, thereby fostering higher savings rates, more productive teams, and more effective bureaucracies. After demonstrating how test scores that matter little for individuals can mean a world of difference for nations, the book leaves readers with policy-oriented conclusions and hopeful speculation: Whether we lift up the bottom through changing the nature of work, institutional improvements, or freer immigration, it is possible that this period of massive global inequality will be a short season by the standards of human history if we raise our global IQ.

This book will train for both accuracy and speed in navigating common types of questions on a standardized psychometric test, developing strategies for the most challenging logic problems, and making the most of natural intelligence.

In these pages, the authors of the widely-acclaimed The Wellness Syndrome throw themselves headlong into the world of self-optimization, a burgeoning movement that seeks to transcend the limits placed on us by being merely human, whether the febleness of our bodies or our mental incapacities. Cederström and Spicer, though willing guinea pigs in an extraordinary (and sometimes downright dangerous) range of techniques and technologies, had hitherto undertaken little by way of self-improvement. They had rarely seen the inside of a gym, let alone utilized apps that deliver electric shocks in pursuit of improved concentration. But, in the course of a year spent researching this book, they wore head-bands designed to optimize meditation, attempted to boost their memory through learning associative techniques (and failed to be admitted to MENSA), trained for weightlifting competitions, wrote what they (still) hope might become a bestselling Scandinavian detective story, enrolled in motivational seminars and tantra sex workshops, attended new-age retreats and man-camps, underwent plastic surgery, and experimented with vibrators and productivity drugs. André even addressed a London subway car whilst (nearly) naked in an attempt to boost attention. Somewhat surprisingly, the two young professors survived this year of rigorous research. Further, they have drawn deeply on it to produce a hilarious and eye-opening book. Written in the form of two parallel diaries, Desperately Seeking Self-Improvement provides a biting analysis of the narcissism and individual competitiveness that increasingly pervades a culture in which social solutions are receding and individual self-improvement is the only option left. “A riveting look at the birth of a new science.” –Daniel H. Pink, author of Drive When he was eight years old, Dan Hurley was labeled a “slow learner” because he still couldn’t read. Three years later, he had become a straight A student. Until the publication of a major study in 2008, psychologists believed that intelligence is fixed at birth, that IQ is like a number tattooed on the soul. The new study showed that people can increase their “fluid” intelligence through training. Hurley, who grew up to become an award-winning science journalist, first explored the topic in The New York Times Magazine. In Smarter, he digs deeper by meeting with the field’s leading researchers—and becoming a human guinea pig. After just three months of playing computer brain-training games, joining a boot-camp exercise program, learning to play the Renaissance lute, practicing mindfulness meditation and and even getting his brain zapped in the name of science, Hurley improved his fluid intelligence by sixteen percent. With humor and heart, Smarter chronicles the roiling field of intelligence research and delivers practical findings to sharpen the minds of children, young adults, seniors, and those with cognitive challenges.

In recent years, reported racial disparities in IQ scores have been the subject of raging debates in the behavioral and social sciences and education. What can be made of these test results in the context of current scientific knowledge about human evolution and cognition? Unfortunately, discussion of these issues has tended to generate more heat than light. Now, the distinguished authors of this book offer powerful new illumination. Representing a range of disciplines--psychology, anthropology, biology, economics, history, philosophy, sociology, and statistics--the authors review the concept of race and then the concept of intelligence. Presenting a wide range of findings, they put the experience of the United States--so frequently the only focus of attention--in global perspective. They also show that the human species has no "races" in the biological sense (though cultures have a variety of folk concepts of "race"), that there is no single form of intelligence, and that formal education helps individuals to develop a variety of cognitive abilities. Race and Intelligence offers the most comprehensive and definitive response thus far to claims of innate differences in intelligence among races.
