A View of A.K. Ramanujan’s Poetics

Five to Thrive [series]

Mirror of Parliament

In an ocean where myriads of rivers converge, can one sole river lend the ocean its distinct flavour? For someone who is at home with several languages, literary traditions and disciplines, is it possible for one form to criss-cross the landscape of another? In a poet’s world of mirrors, where stream and earth are sky, one may ‘sometimes count every orange on a tree’, but can one count ‘all the trees in a single orange’? In this volume, Guillermo Rodriguez explores these possibilities by analysing the works of one of India’s finest poets, translators, essayists and scholars of the twentieth century, A.K. Ramanujan (1929-1993).

“Because of its focus specifically on the needs of the secondary ELA classroom teacher (and students), this book in the Five to Thrive series takes a slightly different approach, focusing less on content and more on instructional philosophy and wellbeing. The five sections address some of the major shifts that have occurred over the past 5-10 years, specifically around engagement and motivation, equity and cultural relevance, building and sustaining community in the classroom, feedback and assessment, and teacher well-being. The authors each have strong voices on these topics, and their combined 40+ years in ELA classrooms – as well as the lessons learned during the pandemic year(s) – will help new and early career teachers to feel support in areas they may not have received pre-service instruction or practice in!”--

It may be surprising to us now, but the taxidermists who filled the museums, zoos, and aquaria of the twentieth century were also among the first to become aware of the devastating effects of careless human interaction with the natural world. Witnessing firsthand the decimation caused by hide hunters, commercial feather collectors, whalers, big game hunters, and poachers, these museum taxidermists recognized the existential threat to critically endangered species and the urgent need to protect them. The compelling exhibits they created—as well as the scientific field work, popular writing, and lobbying they undertook—established a vital leadership role in the early conservation movement for American museums that persists to this day. Through their individual research expeditions and collective efforts to arouse demand for environmental protections, this remarkable cohort—including William T. Hornaday, Carl E. Akeley, and several lesser-known colleagues—created our popular understanding of the animal world and its fragile habitats. For generations of museum visitors, they turned the glass of an exhibition case into a window on nature—and a mirror in which to reflect on our responsibility for its conservation.

This book provides a systematic scientific approach to the understanding of hydraulic fracturing (fracking) as a hydrocarbon extraction technology and its impact on the environment. The book addresses research from the past decade to assess how fracking can affect air, water, landscapes and ecosystems, and presents the subject in the context of the history of fracking and shale gas development in the United States, describing what is known and not known about environmental impacts, and the broader implications of fossil energy use, climate change, and technology development. In 9 chapters, the author lays out how and why hydraulic fracturing was developed, what driving forces existed at the beginning of the so-called “shale revolution”, how success was achieved, and when and why public acceptance of the technology changed. The intended audience is scientific people who are concerned about fracking, but perhaps do not know all that much about it. It is also intended for lay people who would be interested in understanding the technical details of the process and what effects it might or might not be having on the environment. The book is written at a level that is both understandable and technically correct. A further goal is to give some useful insights even to experienced petroleum geologists and engineers who have been doing fracking for many years.
