This is the full Mueller Report, as released on April 18, 2019, by the U.S. Department of Justice. A reprint of the report exactly as it was issued by the government, it is without analysis or commentary from any other source and with nothing subtracted except for the material redacted by the Department of Justice. The mission of the Mueller investigation was to examine Russian interference in the 2016 Presidential election, consisting of possible links, or "collusion," between the Donald Trump campaign and the

Russian government of Vladimir Putin as well as any allegations of obstruction of justice in this regard. It was also intended to detect and prosecute, where warranted, any other crimes that surfaced during the course of the investigation. The report consists of a detailed summary of the various investigations and inquiries that the Special Counsel and colleagues carried out in these areas. The investigation was initiated in the aftermath of the firing of FBI Director James Comey by Donald Trump on May 9, 2017. The FBI, under Director Comey, had already been investigating links between Russia and the Trump campaign. Mueller submitted his report to Attorney General William Barr on March 22, 2019, and the Department of Justice released the redacted report one month

The majority of people can expect to experience neck pain in their lifetime and some will go on to develop prolonged or repetitive episodes of neck pain or related symptoms. These persistent complaints have become a major cause of disability around the world. Although chronic 'mechanical' neck pain can be defined in clinical terms, the underlying pathology remains unclear. Research has failed to demonstrate a consistent relationship between the presence of neck pain and pathology such as degenerative changes. As such, there has been an increasing interest in altered neuro-muscular-articular function in the pathogenesis of neck pain. Over the last 17 years, the role of cervical proprioceptive

(mechanoreceptive) dysfunction in the perpetuation of chronic neck pain has received increasing attention from researchers and clinicians. This is commonly referred to as cervicocephalic kinaesthetic sensibility (KS). Cervicocephalic KS has generally been studied utilising head repositioning accuracy (HRA) tasks. At the beginning of this study only seven reports had been published in the area. Following review of this literature, several focused areas of interest were apparent for further study - 1) comparison of KS in various patient subgroups (e.g., insidious onset vs 'whiplash'); 2) development of more sophisticated methods of measuring head movement and repositioning errors; 3) establishing the characteristics of the tests such as method agreement and

reliability; 4) comparison of the discriminative value of repositioning tasks to both subjective 'straight ahead' (SSA) and to non-neutral set points within the cervical range of motion (non-straight ahead or nSA). Investigation 1 used a laser pointer method to study head repositioning errors in patients with chronic neck pain of insidious onset. The results suggested that these patients with chronic neck pain show little evidence of impaired cervicocephalic KS, when measured as HRA-SSA. The study also served to highlight several difficulties with the laser pointer method of measurement and the relatively poor knowledge of HRA in healthy subjects. Most previous studies used the mean of 10 repetitions for the measurement but more recent studies utilised fewer

repetitions. Although the laser pointer method is simple, inexpensive and easy to use, the method involves a degree of experimenter bias and inaccuracy. It also does not lend itself to concurrent evaluation of variables such as range of motion and speed of head movement. Investigations 2 & 3 focused on the development of the testing method and the introduction of the Zebris CMS 70P ultrasound system for the recording of HRA-SSA, namely; method agreement between a 5 and 10 repetition measuring protocol; method agreement between the laser pointer and Zebris system; the intra/inter-examiner reliability of measurement methods. The Zebris system results suggested that the two methods of measurement agree sufficiently well for the 5 repetition method to replace the 10

repetition method to obtain a mean HRA score and that both could be used interchangeably. Further results suggested that the Zebris and laser pointer methods do not agree sufficiently well to be used interchangeably. The test-retest reliability was comparable between both methods suggesting that from this perspective, either could be used for measuring HRA-SSA. The inter-rater test-retest reliability was comparable to the test-retest reliability suggesting that trained examiners could be interchanged when carrying out repeated measurements. Investigation 4, the final study in this thesis, investigated HRA with the Zebris system using the 5 repetition protocol in two groups of chronic neck pain patients; insidious onset and neck pain from a 'whiplash' injury. The results suggested that

patients with chronic neck pain of both insidious onset and from a 'whiplash' injury show little evidence of impaired cervicocephalic KS when measured using HRASSA and nSA tests. These results conflict with previous studies Despite numerous investigations over the last 17 years, a test that can be routinely applied in the clinical setting for the purposes of diagnosis and treatment monitoring has not been established. Studies to date suggest that an active HRA test to SSA/NHP that is established by the patient may have the greatest discriminative value. Although HRA testing shows some promise in identifying deficits in 'whiplash' patients, it is unlikely that the KS tests identify specific subgroups of chronic neck pain patients. There have been several contradictory

studies which have shown considerable overlap between patient and healthy groups. It is also unlikely that HRA tests represent a unique test of cervical proprioceptive function (peripheral or central integration) and therefore provide a test exclusive to neck disorders.

Scores of talented and dedicated people serve the forensic science community, performing vitally important work. However, they are often constrained by lack of adequate resources, sound policies, and national support. It is clear that change and advancements, both systematic and scientific, are needed in a number of forensic science disciplines to ensure the reliability of work, establish enforceable standards, and promote best practices with consistent application. Strengthening Forensic Science in the United States: A Path Forward provides a detailed

plan for addressing these needs and suggests the creation of a new government entity, the National Institute of Forensic Science, to establish and enforce standards within the forensic science community. The benefits of improving and regulating the forensic science discipline are clear: assisting law enforcement officials, enhancing homeland security, and reducing the risk of wrongful conviction and exoneration. Strengthening Forensic Science in the United States gives a full account of what is needed to advance the forensic science disciplines, including upgrading of systems and organizational structures, better training, widespread adoption of

While this book provides an essential call-to-action for congress and policy makers, it also serves as a vital tool for law enforcement agencies, criminal prosecutors and attorneys, and forensic science educators.

beaten and stabbed from behind minutes later. Lauren didn't see her attacker, but knows it was a fellow police officer from the city-issued boots she glimpsed as she passed out. Stolen during the attack is the Murder Book, which contains evidence on all active cold cases. Without the book, old homicides became almost impossible to track down. Who in police headquarters would try to kill a fellow officer? Why'd they suddenly want the Murder Book? Although hurt and on enforced leave, nothing will stop Lauren from seeking answers . . . but who on the force can she trust and how safe is she within her own home?

In every mathematics classroom, the need for differentiated instruction is present: in many its acute. Students learn at different rates, in different ways, with different successes and different challenges. Instruction must be flexible enough to meet everyones needs and nurturing enough to not only support growth but also address the frustration that often leads to mathphobia. The Differentiated Math Classroom can help make high-quality differentiated instruction a classroom reality. Its the usable, comprehensive resource teachers need to help students of all levels and abilities succeed with

math. Whether you teach math sixty minutes a day or six periods a day, *The Differentiated Math Classroom* describes both the big ideas of differentiation and the day-to-day teaching that makes it work. Miki Murray and Jenny Jorgensen present everything you need to get started and to help all students meet national standards, including ideas for: Setting up a classroom to maximize opportunities for differentiation and establish community Getting to know students strengths and needs through high-quality assessments Devising anchor activities that help students work independently with meaningful math content while you free up time for individual instruction Creating tiered lessons that scaffold content and provide the flexibility to challenge some students and offer

assistance to others. Murray and Jorgensen offer practical ideas for planning and designing units that engage students and facilitate learning about important math concepts, as well as teaching tools, questions for professional reflection, and answers to teachers most frequently asked questions about differentiation.

Discover that differentiated instruction is a flexible framework that supports all math learners. Filled with examples from real classes and samples of student work, The Differentiated Math Classroom will help every child learn more effectively by showing you how to think about students, mathematics, and your teaching in powerful new ways.

finds herself surrounded by patients who all have some skeletons in their closets. A higher number of deaths than usual seem to occur on this ward. On her very first night, Mrs Hudson believes she witnesses a murder. But was it real, or just smoke and mirrors? Mary Watson meanwhile has heard about young boys disappearing across London, and is determined to find them and reunite them with their families. As the women's investigations collide in unexpected ways, a gruesome discovery in Regent's Park leads them on to a new, terrifying case.
