Evolutionary theory has been strikingly silent about how employee compensation might differ in an evolutionary framework compared to a static one. This is important

because employee compensation is a key measure of economic performance, complementing other measures such as growth and survival. This book argues that the link between

entrepreneurship and wages is different in an evolutionary context than in the traditional static analysis, suggesting that, particularly in knowledge-based industries, firms will pay relatively lower levels of

employee compensation subsequent to startup. If the firm learns that it is viable, and survives and grows, levels of employee compensation will rapidly rise.
