The Republic of Indonesia, home to over 240 million people, is the world's fourth most populous nation. Ethnically, culturally, and economically diverse, the Indonesian people are broadly dispersed across an archipelago of more than 13,000 islands. Rapid urbanization has given rise to one megacity (Jakarta) and to 10 other major metropolitan areas. And yet about half of Indonesians make their homes in rural areas of the country. Indonesia, a signatory to the United Nations Millennium Declaration, has committed to achieving the Millennium Development Goals (MDGs). However, recent estimates suggest that Indonesia will not achieve by the target date of 2015 MDG 4 - reduction by two-thirds of the 1990 under - 5 infant mortality rate (number of children under age 5 who die per 1,000 live births) - and MDG 5 - reduction by three-quarters of the 1990 maternal mortality ratio (number of maternal deaths within 28 days of childbirth in a given year per 100,000 live births). Although much has been achieved, complex and indeed difficult challenges will have to be overcome before maternal and infant mortality are brought into the MDG-prescribed range. Reducing Maternal and Neonatal Mortality in Indonesia is a joint study by the U.S. National Academy of Sciences and the Indonesian Academy of Sciences that evaluates the quality and consistency of the existing data on maternal and neonatal mortality; devises a strategy to achieve the Millennium Development Goals related to maternal mortality, fetal mortality (stillbirths), and neonatal mortality; and identifies the highest priority interventions and proposes steps toward development of an effective implementation plan. According to the UN Human Development Index (HDI), in 2012 Indonesia ranked 121st out of 185 countries in human development. However, over the last 20 years the rate of improvement in Indonesia\'s HDI ranking has exceeded the world average. This progress may be attributable in part to the fact that Indonesia has put considerable effort into meeting the MDGs. This report is intended to be a contribution toward achieving the Millennium Development Goals.

Improved conditions of care for premature infants have led to markedly increased survival rates over the last few decades, particularly in very low and extremely low birth weight infants. Nutritional measures play a central role in the long-term outcome, health and quality

of life of these premature infants. In this publication, leading experts from all 5 continents present the most recent evidence and critical analyses of nutrient requirements and the practice of nutritional care (with the focus on very low birth weight infants) to provide

guidance for clinical application. After the introductory chapters, covering nutritional needs and research evidence in a more general manner, topics such as amino acids and proteins, lipids, microminerals and vitamins, parenteral and enteral nutrition as well as

approaches to various disease conditions are addressed. Due to its focus on critical appraisals and recommendations, this book is of interest not only for the researcher who wants to keep up to date, but also for the clinician faced with premature infants in his practice.

Based on her own harrowing experiences and her expertise as a psychiatric social worker, Jo Clancy addresses the parents of preterm babies, discussing the heartbreak and stress involved, the impact on the whole family of the death of the dream of a healthy full-term baby.

She talks about how to survive leaving your baby behind after you've given birth, how to survive the long weeks while the baby is in the neonatal intensive care unit (NICU). She describes the experience of the mother's pain, the father's grief, the pain of the older

children and the grandparents: how to cope with others' reactions to the birth, and the unbearable anguish when the baby dies. She describes the mixture of high delight and high anxiety when at last the baby comes home from the neonatal unit. A central motif of this hands-

on survival guide is that parents must not be shy about seeking help, in fact they can't survive without it - whether from family, friends, coworkers, Social Security or the local school system. A useful reading list and resource guide will help new parents of preemies

find what they need to survive. The book ends with the very moving diary Jo Clancy kept, addressed to her son Vincent, while he hovered for weeks between life and death in the infant intensive care unit. The whole emotional roller-coaster ride of joy at small improvements,

and terror at the innumerable crises that make up the experience of parenting a preterm baby is there.

Nurses are already nurse managers. They must manage patient caseloads and care plans as well as supervise aides, technicians, and other care providers. But moving from this type of organic management to a defined nurse manager role is not a natural progression. Nurse managers must command a vast, diverse, and robust skill set, and those skills must first be defined, explained, and operationalized for success. In an environment that offers new managers little support, where do they turn? The Nurse Manager 's Survival Guide (4th Ed.) provides an overview of a nurse manager 's major roles and responsibilities—all the fundamentals needed for success in one easy-to-use, consolidated, practical reference. From tips on building the right team to budgeting basics, time-management tools, and advice on taking care of one 's self (and their team), author Tina Marrelli supplies the resources nurse managers need to excel in day-to-day operations.
