Clinical-Electrophysiologic Correlations (Expert Consult - Online)

Since its first edition in 1994, Neurology in Practice has fulfilled its objective to enhance the practice of neurology, and has been proven useful to students, physicians and allied health professionals. In this Fourth Edition, the authors continue to emphasize that a sound clinical approach is the key to the diagnosis and management of neurological disorders. Thus, relevant neuroanatomical principles and simulated neurological manifestations are incorporated in the first chapter. All chapters have been updated with knowledge gained from major advances in neuroscience. Two new chapters have also been added: "Neurodiagnostic Tests" and "Neurological Manifestations of Systemic Disorders and Neurotoxicology".

The Neurology of Eye Movements provides clinicians with a synthesis of current scientific information that can be applied to the diagnosis and treatment of disorders of ocular motility. Basic scientists will also benefit from descriptions of how data from anatomical, electrophysiological, pharmacological, and imaging studies can be directly applied to the study of disease. By critically reviewing such basic studies, the authors build a conceptual framework that can be applied to the interpretation of abnormal ocular motor behavior at the bedside. These syntheses are summarized in displays, new figures, schematics and tables. Early chapters discuss the visual need and neural basis for each functional class of eye movements. Two large chapters deal with the evaluation of double vision and systematically evaluate how many disorders of the central nervous system affect eye movements. This edition has been extensively rewritten, and contains many new figures and an up-to-date section on the treatment of abnormal eye movements such as nystagmus. A major innovation has been the development of an option to read the book from a compact disc, make use of hypertext links (which bridge basic science to clinical issues), and view the major disorders of eye movements in over 60 video clips. This volume will provide pertinent, up-to-date information to neurologists, neuroscientists, ophthalmologists, visual scientists, otalaryngologists, optometrists, biomedical engineers, and psychologists.

One in ten children seen in primary care practice and 25% of hospitalized children appear with a neurologic complaint. The fourth edition of Current Management in Child Neurology provides succinct reviews in the form of superb "how-to" chapters on the most common neurological complaints and pathologic conditions seen in pediatric practice. This volume provides clinicians with a state-of-the-art "toolbox" for diagnosis and treatment of the most commonly presented neurologic disorders and dysfunctions in children, including headache, seizures and epilepsy, neurobehavioral disorders, school readiness, developmental delay, trauma, meningitis and encephalitis, injury to the preterm and term brains, and status epilepticus. Chapters new to the 4th edition include information on a range of other conditions such as microcephaly, neurodegenerative disorders, chromosomal disorders, epilepsy in adolescence, epileptic encephalopathy, pediatric neurotransmitter disorders, and tropical child neurology as well as current approaches to neonatal or infantile facial dysmorphism and congenital muscular dystrophies. The 4th edition of Current Management in Child Neurology has 111 chapters organized into three sections: Clinical Practice Trends, The Office Visit, and The Hospitalized Child. Each of the sections contains carefully selected readings and Web resources for practitioners and patients who seek relevant information on topics addressed in the book's chapters. Since the third edition, online resources have increased exponentially, and Current Management in Child Neurology directs its readers to the most high-quality information available.
