renders it difficult to argue that accounting information necessarily produce a better basis for decision-making than arguments which are not based on accounting. This is because, as previous research has also argued, accounting counts some things but omits many others, while managers are accountable for much more than what accounting actually counts. Recent work in applied linguistics has expanded our understanding of the rule governed nature of language. The concept of an idealized speaker-hearer whose linguistic competence is abstract and separate from reality has been enriched by the notion of an actual interlocutor who possesses communicative competence, a knowledge of language which accounts for its use in real-world contexts. Areas of variation previously relegated to idiosyncratic differences in performance have been found to be dynamic yet consistent and lend themselves to study and systematic description. Because language acquisition involves the development

of communicative competence, by its very nature it incorporates variation and systematicity. Second-language acquisition is similarly variable, since interlanguage is subject to the same universal and language-specific conventions. In addition, aspects of the second language have been found to be unevenly acquired and are differentially reflected in particular contexts or settings. Yet, despite our expanding knowledge, this variability is only beginning to be treated in much of the second-language acquisition literature. This volume presents the work of some researchers and methodologists who have taken on the challenge of including variation in their research designs and pedagogical recommendations.

Variation is shown to be relevant to linguistic, social, and psychological aspects of language. It is apparent in the registers and dialects of the target language and in the inter language of learners.

This book covers various aspects of rubber to rubber adhesion. Rubber is a polymer whose glass transition temperature is well below the room temperature and hence the chains are very mobile at room and higher temperatures.
