Second edition. Revised and updated (January 2021). With free graphic simulation software, upgrade of procedures and images. This book is designed for students and teachers who are looking for a programming course in combination with a graphic simulation software. The course is based on the understanding of the 'ISO Standard' functions, i.e. the programming language at the basis of all numeric controls. The training and simulating software faithfully replicates a real numeric control on your computer. This course comprises chapters and paragraphs for both theoretical and practical learning. Paragraphs on theory contain drawings and diagrams that simplify the understanding of the text. The first practical experiences consist in the utilization of pre-drafted programs, which are useful to the participant's initial understanding of the numeric control and its potential. Later you will learn how to write new programs with difficulty levels that are commensurate to the acquired experience. During the practical exercises the reader is constantly guided by the respective operating procedures. The learning method has been developed so that even beginners may complete the course and understand all the most complex functions and programming methods. Periodical tests are offered in order to help the students and teachers assess progress achieved or to highlight the topics for review. This is a fifty-hour course. The total number of hours necessary for the understanding of the theoretical part and for carrying out the practical exercises will always be specified at the beginning of each chapter. The course is centered on a three-axis lathe (X, Z, C) with driven tools, then the concepts applied to the programming of the lathe will be used to program a three-axis vertical mill (X, Y, Z). All the programs used during the explanations and the collection of the images contained in the book, which may be printed, viewed or displayed during the course at home or in the classroom may be downloaded from the website cncwebschool.com. Finally the book contains a list of technical terms and their translation from English into Italian and German.

This book describes and analyzes how seven major high-tech industries evolved in the United States, Japan, and Western Europe. The industries covered are machine tools, organic chemical products, pharmaceuticals, medical devices, computers, semiconductors, and software. In each of these industries, firms located in one or a very few countries became the clear technological and commercial leaders. In a number of cases, the locus of leadership changed, sometimes more than once, over the course of the histories studied. The focus of the book is on the key factors that supported the emergence of national leadership in each industry, and the reasons behind the shifts when they occurred. Special attention is given to the national policies that helped to create or sustain industrial leadership.

Study on the virtual CNC machining environment is one of the key parts of virtual manufacturing technology. According to the features of CNC milling (OKUMA MX- 45V A), this paper presented the steps taken to develop virtual CNC milling using DELMIA Virtual NC Software. The virtual CNC Milling is controlled through the NC Program (O & M codes) used by the actual machine tool, therefore the developed virtual CNC milling machine loaded with NC Programs to simulate the movements of the machine mechanism. NC Program with collision also has been loaded to this virtual machine to simulate the collision detection. Finally, two NC Programs that simulated in virtual environment has been transfer to actual machine to study the similarities and the differences between virtual and actual CNC machining.

This manual covers three very popular versions of parametric programming. Fanuc's custom macro B is by far the most popular version, and is the version of parametric programming being used by any control manufacturer claiming to be Fanuc-compatible (Yasnac, Haas, Mitsubishi, Mazatrol's eia, Seikos, among others). But even if you don't have Fanuc controls, this manual also includes presentations of Okuma's user task 2 and Fadal's macro. Over 80% of CNC machines used today are covered!All presentations are applications based. Each step of the way, we show real-world applications that you can easily adapt to your specific needs. There are plenty of examples and we stress the reasons why features are available as well as how they can help you (compare this your control manufacturer's descriptions of parametric programming).

Enterprise Architects, in their endeavor to achieve Enterprise Integration, have limited guidance on how best to use Enterprise Models and Modeling Tools to support their practice. It is widely recognized that the practice of engineering enterprises needs a number of models, but how to maintain the relation between these models with ease is still a problem. Model interoperability is an issue on multiople counts: - How to interchange models between enterprise modeling tools? - How to maintain the interdependencies between models - whether they describe the enterprise on the same level (but from different points of view), or from the same point of view (but on different levels of abstraction and granularity)? -

How to maintain a coherent and evolving set of enterprise models in support onf continuous change processes? - How to use and reuse enterprise models as a knowledge resource? The answers to these questions are of great importance to anyone who is implementing ISO9001:2000 requirements, whether through using enterprise architecture practice or not - although it can be argued that a well executed architecture practice should satisfy ISO9001 without additional effort. This volume attacks the problem on three fronts: 1. Authors working in international standardisation and tool development as well as in enterprise modeling research present the latest developments in semantic integration; 2. Authors who are practitioners of, or conducting active research in, enterprise architecting methodologies give an account on the latest developments and strategic directions in architecture frameworks and methodologies; 3. Authors who use or develop information integration infrastructures present best practice and future trends of this aspect of enterprise integration.

Chapters of this book include contributions to the International Conference on Enterprise Integration and Modelling Technology (ICEIMT'04), and those presented at the Design of Information Infrastructure Systems for Manufacturing (DIISM'04) Workshop. While DIISM is traditionally oriented at supporting manufacturing practice, the results have a far greater domain of applicability.

This book teaches the fundamentals of CNC machining. Topics include safety, CNC tools, cutting speeds and feeds, coordinate systems, G-codes, 2D, 3D and Turning toolpaths and CNC setups and operation. Emphasis is on using best practices as related to modern CNC and CAD/CAM. This book is particularly well-suited to persons using CNC that do not have a traditional machining background.
